Point of Sale (POS)

Product & QA Guide — counter billing, kitchen, takeaway, offline cash, day close and refunds

Version R40 · October 2026

For merchants & the QA team · live on UAT

Everything you need to run a shop or restaurant counter on BillionBiz, explained in plain language and checked against the live screens. How to switch the POS add-on on and set it up, how to pair counters and sign staff in with a PIN, how to ring up a sale and take payment, how dine-in, takeaway and kitchen tickets work, what happens after the sale (receipts, voids, returns and appointment deposits), how the counter keeps taking cash when the internet drops, and how to close the day. Every flow has a flowchart and a test checklist, so the same pages serve the shop owner learning the counter and the QA team testing it.

8.5 Glossary 117

Part 1 — Overview, Quick Start & Setup

BillionBiz POS, called “Counter” on screen, is the till for a shop or restaurant counter. It runs in its own full-screen window at `/pos`, separate from the Admin Panel. A cashier signs in with a 6-digit PIN, taps items to build a bill, takes payment and prints or shares the receipt. The owner sets everything up from Admin.

This part covers what POS is, who uses it, how it is switched on, every setting the owner controls, and a 10-step Quick Start. Counter devices and sign-in are in Part 2.

1.1 What POS is and who uses it

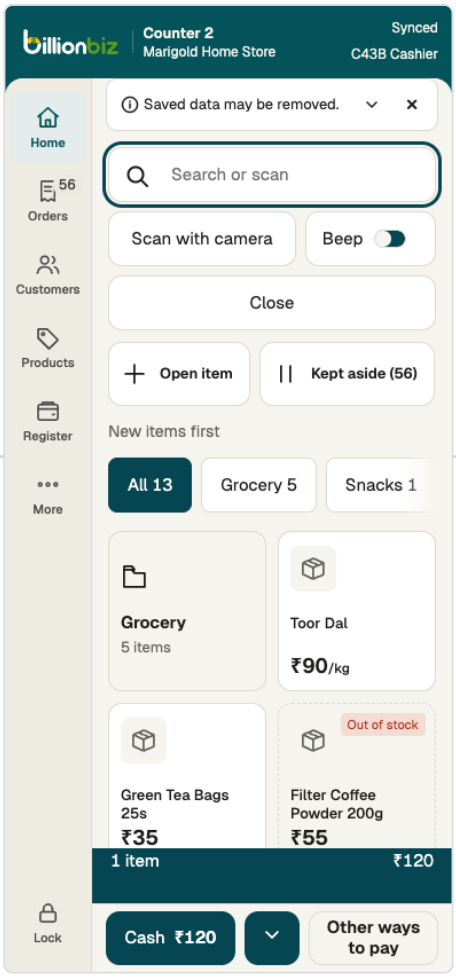

What it’s for. Billing walk-in customers at a counter: retail billing, services, and restaurant dine-in or takeaway, with the same bills, stock and customers as your online store.

Who uses it. Two kinds of people, working in two different places.

Person	Works in	What they do
Owner or admin	The Admin Panel	Buys the POS add-on, adds counters and cashier seats, approves devices, sets PINs, changes Counter settings, reads reports.
Counter staff	The counter window at `/pos`	Sign in with a PIN, ring up sales, take payment, hold bills, give refunds if allowed, lock the counter and close the register.

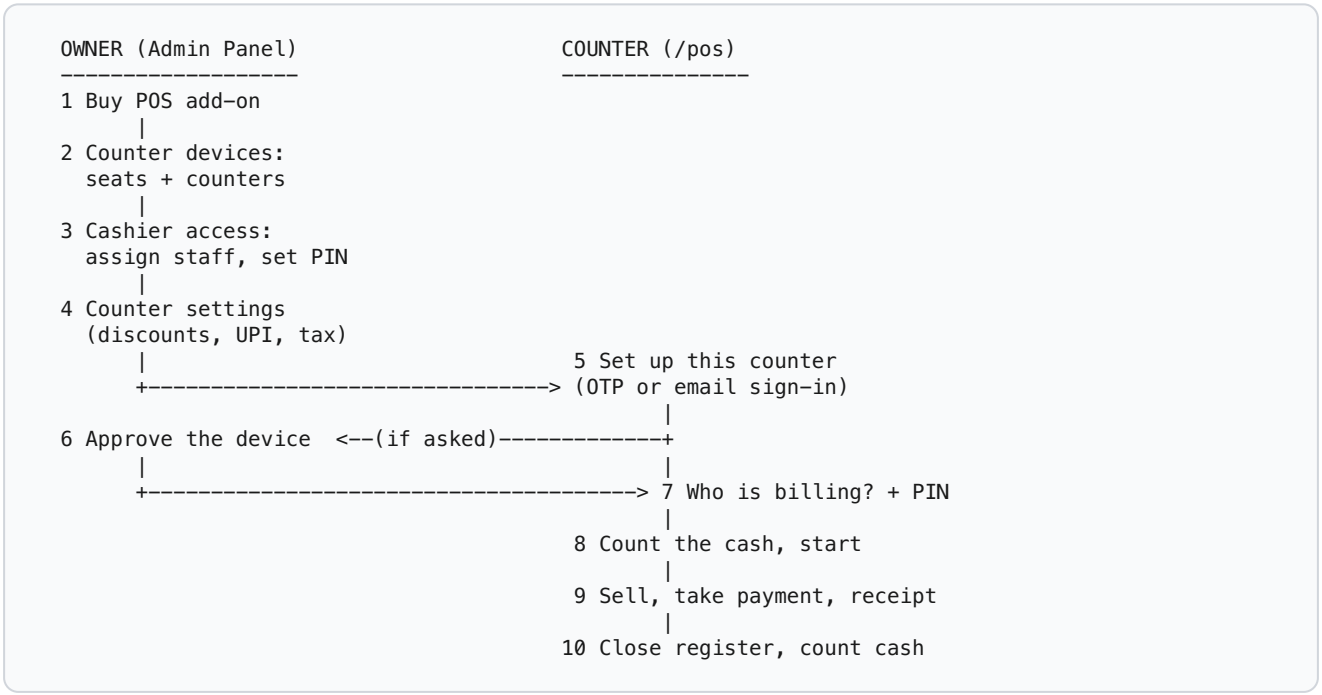

Counter staff appear on the sign-in screen with one of four role labels: **Owner**, **Manager**, **Cashier** or **Order taker**. The owner never uses up a cashier seat.

What you'll see on the counter. A teal top bar with the counter name and store name, a left rail (Home, Orders, Customers, Products, Register, More, Lock) and a cream work area. A phone shows the same screens in a narrower layout.

The counter on a phone (390 px wide): top bar, left rail, search and item grid, and the bill total with Cash and Other ways to pay at the bottom

1.2 The big picture

1.3 Plans and the POS add-on

What it's for. POS is a paid add-on. Your store plan does not include it, and the add-on does not use up your plan's Users allowance.

Who uses it. The owner, from the Admin Panel.

What you can buy

Add-on	What it gives you	Price (per month / per year)
POS	Turns POS on. Includes 1 register, 2 cashier seats and one starter pack of your choice (Retail, Services or Restaurant).	₹499 / ₹4,990
Extra POS register	One more counter.	₹199 / ₹1,990
POS cashier seat	One more person who can sign in with a PIN.	₹149 / ₹1,490

Optional packs add more tools to the counter: Retail ₹199, Services ₹199, Restaurant ₹299 per month. The Supermarket and Salon packs are planned but not on sale yet.

The add-on can be bought on every plan, including Free. The yearly price is ten times the monthly price.

How to switch it on

1. Open **Settings → Billing & Plan → Add-ons** (in the new layout, **Billing & plan → Add-ons**). You can also go straight to `/settings/billing?tab=addons`.
2. Choose **POS**.
3. When asked, pick your included pack: Retail, Services or Restaurant.
4. Complete the purchase. The **Counter devices** group appears in the sidebar.

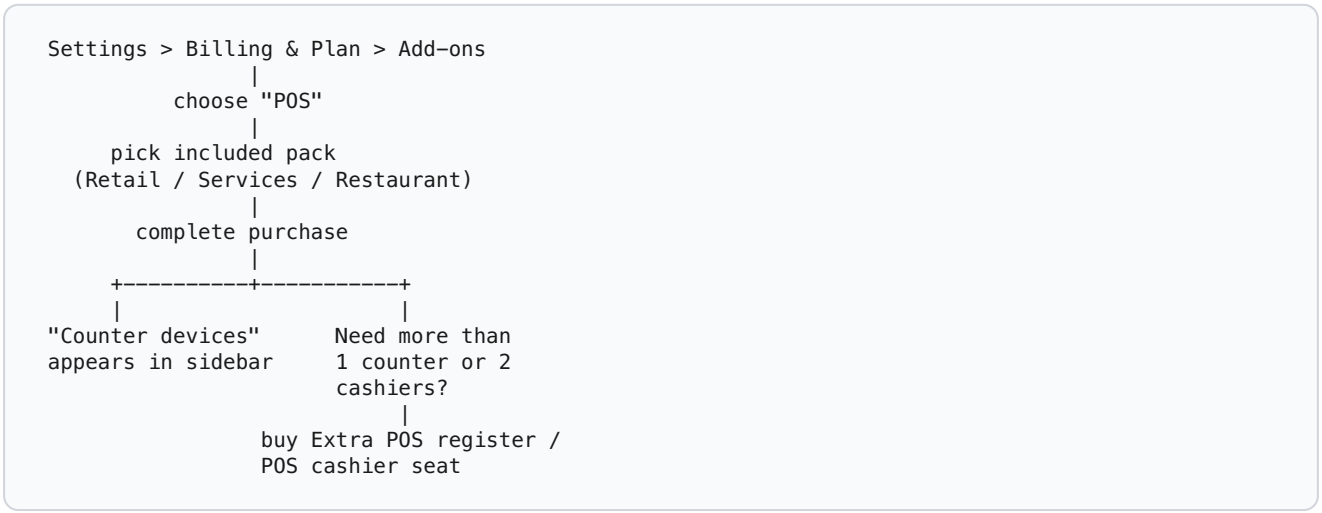

What happens behind the scenes

- The purchase gives your store the POS permission, one register and two cashier seats.
- Extra registers and extra seats are separate purchases. The counter's set-up screen shows "N of M in use" and "Extra seat: price per month" when you run out.
- If you reduce the number of seats, the newest cashiers are locked first. When you add seats back, the oldest locked cashiers are restored first.

What you'll see in each state

State	Admin screens say	Counter does
Active	Normal.	Normal selling.
Lapsed (add-on ended)	"Counter sales are paused. Past bills and obligations remain available."	Cannot sell. Can still view bills and undo. See Part 2.
Never bought	"The counter add-on is not active. Other payment flows remain available."	Counter will not open for selling.

Flowchart: switching POS on

Test checklist: add-on

#	What you do	What you should see	If you see something else
1	On a store that never bought POS, open the **Counter devices** page.	The message "The counter add-on is not active. Other payment flows remain available."	Report the screen and the plan. A fully working counter page on a store with no add-on is a defect.
2	Go to **Settings → Billing & Plan → Add-ons** and buy **POS**, choosing the Retail pack.	Purchase succeeds. **Counter devices** appears in the sidebar.	If POS is not listed at all, note the environment. The add-on may not be switched on for it yet.
3	Open **Counter devices**.	You can add one counter and two cashier seats.	A different limit means the purchase did not apply. Capture the page.
4	Try to add a third cashier.	The page refuses the assignment, points to buying a seat, and offers **Transfer counter access from** an existing holder. Capture the exact wording.	If a third cashier is allowed with no extra seat, report it.
5	Try to add a second counter.	"You have reached the counter limit for your plan."	A second counter appearing with no purchase is a defect.

1.4 Counter settings (the owner's control panel)

What it's for. Rules that apply to every counter in the store: how much discount staff may give, how UPI payments are checked, how tax is printed, when the day starts, and what happens to no-show deposits.

Who uses it. The owner. Other users can open the page but see “Read-only. Ask the store owner to change these settings.” and cannot save.

Nav path: Admin → Counter settings (`/settings/pos`). The page has five tabs: **Discounts**, **UPI**, **Tax**, **Day & alerts** and **No-show deposits**.

Discounts tab

Control	Effect
Allow discounts at the counter	Master switch. Off means nobody can give a discount from the counter.
Limit what cashiers can give with **Cashier cap (%)**	The biggest percentage a cashier may take off a bill on their own.
Ask owner above this discount with **Owner approval above (%)**	A discount above this percentage needs the owner’s approval before it applies.
Edit reason buttons	The one-tap reasons a cashier picks when giving a discount. Keep between 1 and 8 reasons, each up to 40 characters. A reason is required for every discount. The counter always adds an **Other** button that opens a text box, so do not add one yourself.

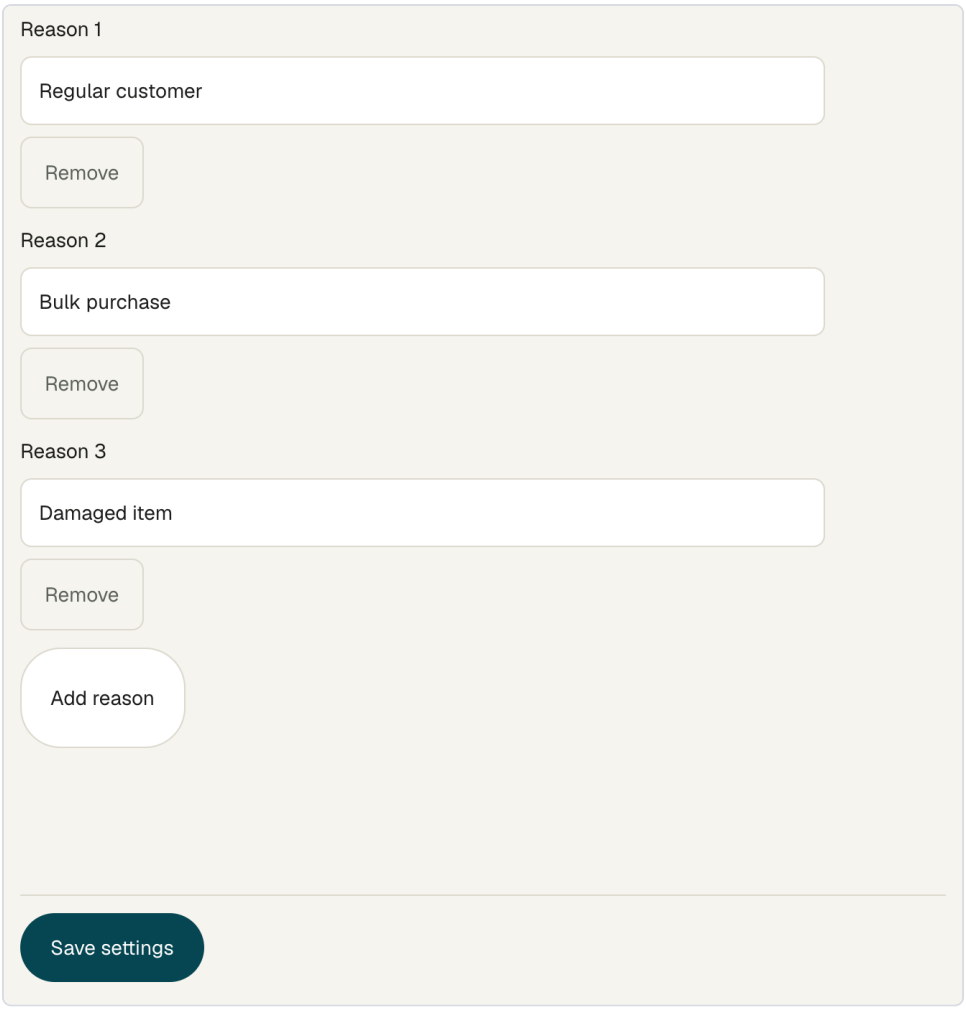

If Owner approval is set at or above the cashier cap, the page warns “Owner approval is at or above the cashier cap; cashiers cannot reach this threshold.” In that case a cashier is stopped at the cap before the owner-approval step is ever reached.

Add, rename or remove a reason button

1. Open **Counter settings → Discounts** and choose **Edit reason buttons** to open the list. The boxes are numbered **Reason 1**, **Reason 2** and so on, in the order the cashier sees them.
2. To rename one, type over its wording (up to 40 characters).
3. To add one, choose **Add reason** under the last box. A new empty box appears at the end. Type the wording.
4. To remove one, choose **Remove** under its box. The boxes renumber. When only one box is left, **Remove** is hidden, because at least one reason is needed. At 8 boxes **Add reason** is greyed out.

5. Choose **Save settings**. Nothing changes until you save. Blank boxes are dropped on save.

Do not add a button called **Other**: the save refuses it, and the counter already adds **Other** last. Two buttons with the same name (ignoring capitals) are refused too. A refused save shows “Settings could not load or save. Check the values and try again.” If no reasons are saved, the counter falls back to Regular customer, Bulk purchase, Damaged item, Festival offer and Staff. A non-owner sees the boxes locked and no **Add reason** or **Remove** buttons.

Discounts tab reason boxes (Reasons 1 to 3, each with Remove under it), the Add reason button and Save settings

UPI tab

Control	Effect
UPI ID, **Payee name** and **Save UPI ID**	The UPI address and name used for UPI payments at the counter.
Confirm ₹1 receipt	A manual check. Send ₹1 to your UPI ID from another phone (or scan the ₹1 verification QR), check your bank app, then choose **I received ₹1** or **Not received**. It records your confirmation only. It does not verify the bank account.
Owner code	Changing a saved UPI ID asks for a 6-digit owner code sent to the owner, from an approved counter device. The old UPI ID stays in force until the code is verified. Changing the ID also clears the old ₹1 confirmation.

Tax tab

Control	Effect
How do you charge GST?: **Regular GST**, **Composition · no GST charged** or **No GSTIN**, then **Save tax scheme**	How the counter charges GST on bills.
My business is above the e-invoice limit, then **Save e-invoice setting**	For stores above the limit. Bills to a GSTIN need an IRN from the government portal, which you upload after billing.
Filed GST months	A declaration of the month you have filed GST through (**Filed through month**). Past months only. Give a reason, choose **Review declaration**, then **Record declaration**. Every correction is audited.
Invoice prefix (up to 3 letters or numbers) and **Save invoice prefix**	Printed at the start of every GST invoice number, for example INV or A1. Use 1 to 3 capital letters or numbers. Set this before your first GST bill.

Day & alerts tab

Control	Effect
Day start (default 04:00)	The store-local day starts at 04:00 by default. Closing registers or tables does not start a new day.
New day starts at and **Counter density** (**Calm** or **Dense**), then **Save day and density**	Restaurant pack only. Other stores cannot change them.
WhatsApp alerts and **Push alerts on this phone**, then **Save alerts**	Alerts for new online orders. Device push permission is managed separately, and store push alerts must be on in Counter settings for push to send.

No-show deposits tab

Control	Effect
Keep the deposit or **Refund the deposit**	What happens to an appointment deposit when the customer does not show up.
One booking override	A single booking can be changed from the **Appointments** screen with **Change deposit decision**.

This setting only governs no-shows. If the counter cancels a booking, the booking's own cancellation window decides the refund.

Shortcut pages from Counter settings

Page	Where	What it does
Kitchen stations	`/settings/pos/kitchen-stations`	Named places in the kitchen that tickets print to (Part 4).
Prepare for offline	`/settings/pos/offline`	Builds a copy of items and prices on the counter so it can sell cash when offline. **Prepare offline copy**, then **Use this copy** or **Keep current copy** (Part 6).
Approvals & audit	`/settings/pos/approvals`	List of owner approvals and an audit trail.

Test checklist: Counter settings

#	What you do	What you should see	If you see something else
1	Sign in to Admin as the store owner and open **Counter settings**.	Five tabs; every field editable.	Missing tabs: check whether the add-on is active.
2	Sign in as a non-owner staff member and open the same page.	The line “Read-only. Ask the store owner to change these settings.” and no working Save buttons.	If a non-owner can save, report it as a permission defect.
3	On **Discounts**, set Cashier cap to 10 and Owner approval above to 20, then save.	The page confirms the save. Reopening the page shows 10 and 20.	A value that does not stick: capture the page and any error.
3a	On **Discounts**, choose **Edit reason buttons**, then **Add reason**, type a wording, and **Save settings**.	A new numbered box appears, and after the save the counter’s discount **Reason** list shows the new wording before **Other**. **Remove** works the same way and renumbers the boxes.	The new reason missing at the counter, or **Add reason** not offered to the owner: capture the page.
4	On **Tax**, type `a1` in **Invoice prefix** and choose **Save invoice prefix**.	The box shows capitals (`A1`). The box takes at most three characters. **Save invoice prefix** stays greyed out until the prefix is 1 to 3 capital letters or numbers. The prefix saves.	If you can type a fourth character, or save an empty or invalid prefix, report it.
5	On **UPI**, save a UPI ID.	The ID is saved and shown.	Capture any error text.

1.5 Quick Start: first sale in 10 steps

1. **Buy the POS add-on.** Settings → Billing & Plan → Add-ons → POS. Pick your starter pack.
2. **Open Counter devices.** In the sidebar open **Counter devices → Counter devices**. Check the counter and seat counts match what you bought.
3. **Add your staff.** Open **Counter devices → Cashier access**. Choose **Assign existing staff**, then **Review access**, then **Confirm access**. Staff must already exist in Admin. If every seat is in use, the form offers **Transfer counter access from** a current holder, or **Review extra seat in Billing**.
4. **Give each person a PIN.** In **Cashier access**, open **Manage access** for the person and choose **Manage staff PIN**, which asks for a **New 6-digit PIN**. Pass the PIN to them privately.
5. **Set the rules.** Open **Counter settings** and fill in discounts, your UPI ID and the Tax tab, including the invoice prefix.
6. **Set up the counter device.** On the till tablet, phone or PC, open the counter window at `/pos`. It shows **Set up this counter**. Sign in with your mobile number and OTP, or choose **Use email instead**. Choose your store, name the device, and pick which counter it is (Part 2).
7. **Approve the device.** If the device shows **Waiting for approval**, open **Counter devices → Counter devices** in Admin and approve it. The counter moves on by itself within about five seconds.
8. **Sign in with your PIN.** The counter shows **Who is billing?**. Tap your name and enter your 6-digit PIN.
9. **Count the cash.** When the counter shows **Count the cash before you start**, enter the amount in **Cash received in drawer** and choose **Start counter**. Part 7 explains when this appears.
10. **Ring up a sale.** Tap an item, choose **Cash** or **Other ways to pay**, and finish. Part 3 explains the bill screen.

Quick Start checklist

#	What you do	What you should see	If you see something else
1	Follow steps 1 to 5 as the owner.	Add-on active, one cashier assigned with a PIN, settings saved.	Go back to the step that failed and use that part's checklist.
2	On a second device, open `/pos`.	**Set up this counter** with a Mobile number box and **Send OTP**.	A blank screen: check the device's internet and reload.
3	Finish set-up and approve the device in Admin.	**Who is billing?** with a tile for each assigned cashier.	**Waiting for approval** for more than a minute after approving: choose **Check now**.

#	What you do	What you should see	If you see something else
4	Tap your name and enter your PIN.	The sixth digit signs you in automatically. The counter opens (it may first ask for the opening cash count).	See Part 2 troubleshooting for wrong-PIN and locked cases.
5	Sell one item for cash.	Charge succeeds and a receipt is available.	Report the screen and the exact message.

1.6 Troubleshooting: setting up POS

Problem	Likely reason	What to do
“Counter devices” is missing from the sidebar.	The add-on is not active, or the store is on a plan view that hides it.	Check **Billing & Plan → Add-ons**.
Cashier cannot be added.	All cashier seats are used.	Buy a **POS cashier seat** or free one up in **Cashier access**.
Counter settings will not save.	You are not the store owner.	Ask the owner. The page says “Read-only. Ask the store owner to change these settings.”
Restaurant settings (New day starts at, Counter density) are missing.	They only appear when the Restaurant pack is on.	Buy or enable the Restaurant pack.

Part 2 — Counter Devices, Staff Sign-in & Exiting POS

This part follows a counter from first set-up to the end of the shift. It covers adding counters and cashier seats, pairing a device, signing staff in with a PIN, locking and switching staff, leaving the counter for Admin, and what happens when the add-on ends.

Two places are involved. The owner works in the **Admin Panel** (Counter devices and Cashier access). Staff work in the **counter window** at `/pos`.

2.1 Counters, devices and seats: the three ideas

Word	What it means
Counter (register)	A named till, such as “Counter 2”. Each counter bought is one register.
Device	A physical tablet, phone or PC that has been set up as a counter. A device is tied to one counter.
Seat	One person allowed to sign in with a PIN. The owner never uses a seat.

Your POS add-on includes 1 counter and 2 seats. More counters and seats are bought separately (Part 1).

2.2 Add a counter and set up a device

What it’s for. Turning a tablet, phone or PC into a counter.

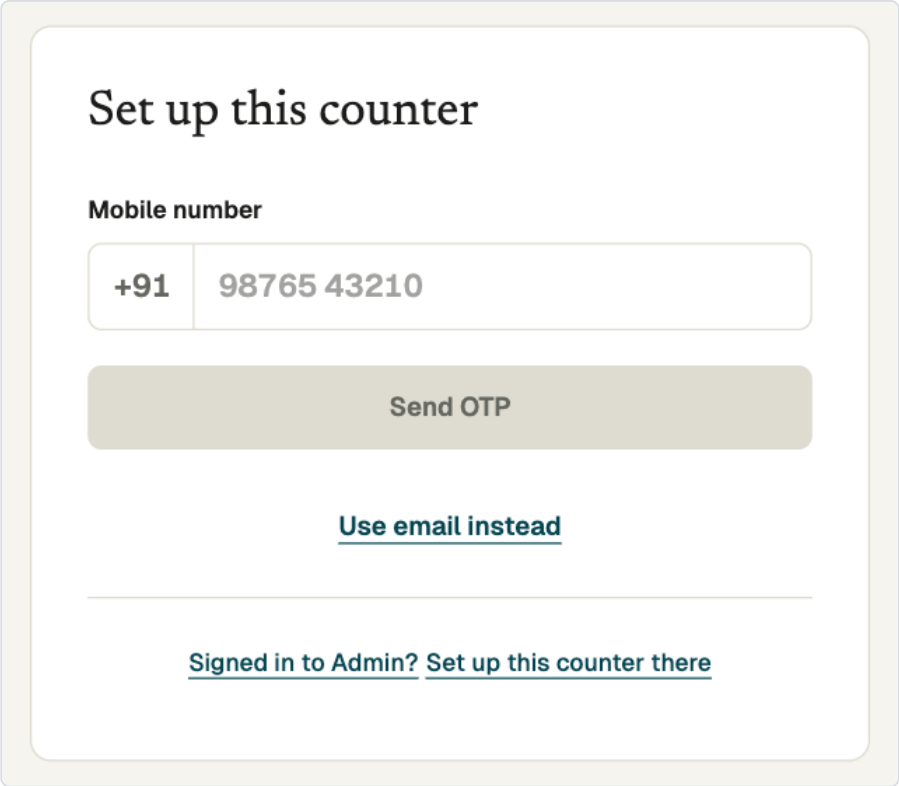

Who uses it. The owner or a manager, on the device that will become the counter.

Nav path: open `/pos` in the device’s browser. The counter window shows **Set up this counter**.

Step by step

1. Open `/pos` on the device. If the device has not been set up, you land on **Set up this counter**.
2. Type your **Mobile number** (the screen shows +91) and choose **Send OTP**. The button stays greyed out until at least 10 digits are typed.
3. Type the code in **Enter the 6-digit OTP** and choose **Verify**. If no code arrives, wait for **Send again in Ns**, then choose **Send OTP again**.
4. Prefer email? Choose **Use email instead**, type your **Email** and **Password**, and choose **Sign in**. **Use phone instead** takes you back.
5. If your account has more than one store, **Choose your store**. If the account has no store with Counter, the screen says “This phone has no store with Counter”.
6. Type a **Name of this counter device**. The box starts with a suggestion such as “Counter device 1”.
7. Under **Which counter is this?**, pick an existing counter, or choose **Add a new counter** and type a **Counter name**. A counter already used by another device is marked **In use on another device**. **Refresh counter list** reloads the list.
8. Choose **Set up this counter**.
9. The counter then shows **Waiting for approval** until the owner approves it (section 2.3), and moves on to **Who is billing?** once it is approved.

If you are already signed in to Admin on this device, the link **Signed in to Admin? Set up this counter there** at the bottom of the card opens Admin's Counter devices page, where **Open POS on this device** does the same job (section 2.3).

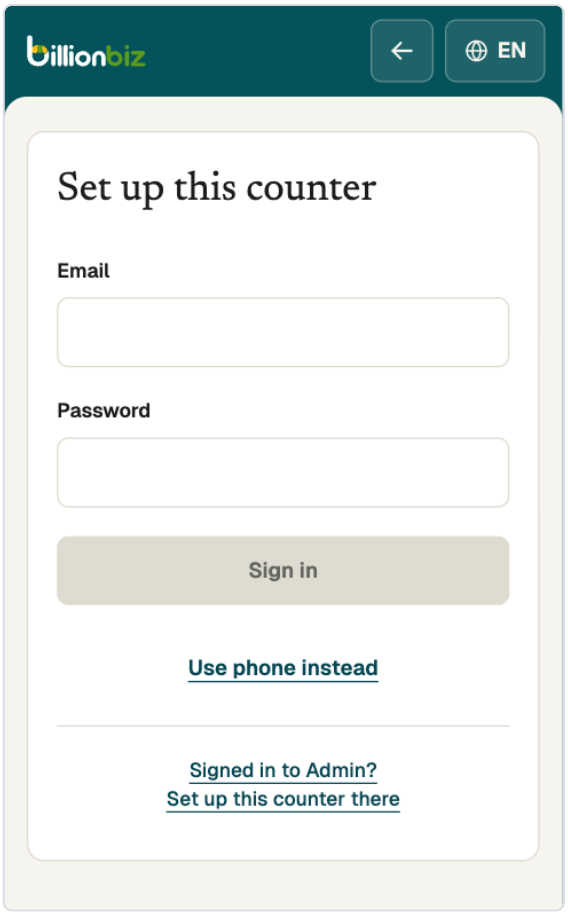

"Set up this counter" on a desktop: Mobile number with +91, Send OTP, Use email instead, and the Signed in to Admin link

What happens behind the scenes

- The counter checks who you are (phone code or email), then which stores you can open, then registers a device under the store.
- A device that is not yet approved cannot sell. It waits.

Messages you may see

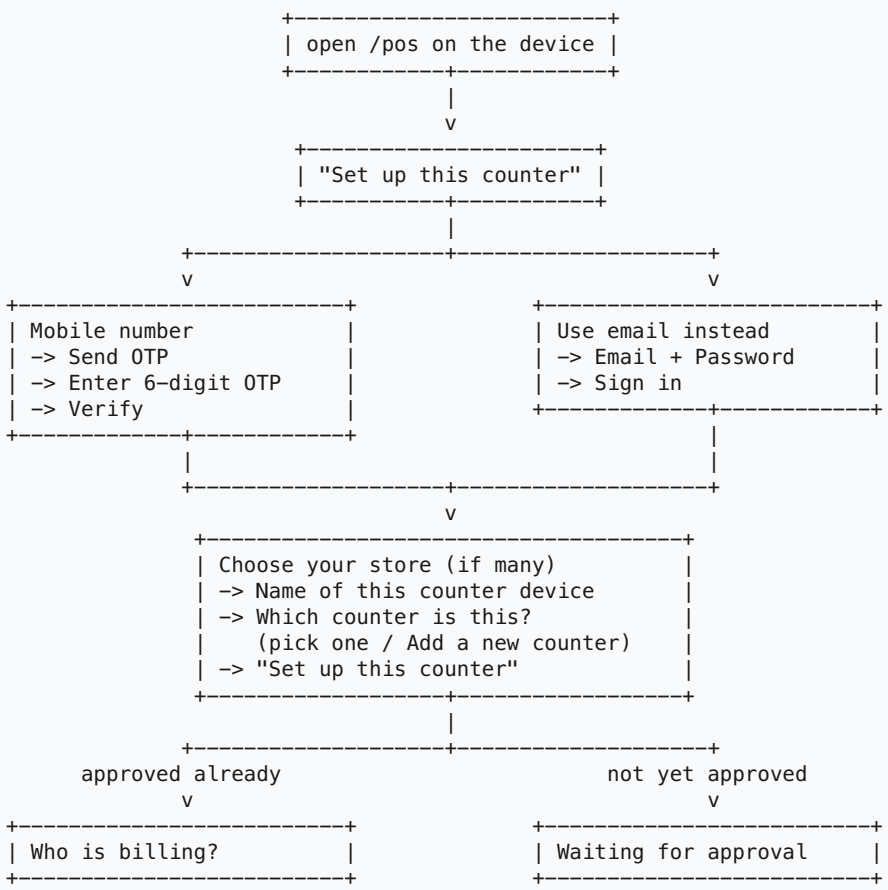

The email step on a phone: Email, Password, Sign in, Use phone instead

Message	What it means	What to do
“Wrong OTP. Check and try again.”	The code was typed wrong.	Retype it.
“This OTP has expired. Ask for a new one.”	The code is too old.	Choose **Send OTP again**.
“Too many tries. Please wait and try again.”	Too many wrong codes.	Wait, then try again.
“You have reached the counter limit for your plan.”	All registers are in use. The screen shows “N of M in use” and “Extra seat: price per month”.	The owner buys an **Extra POS register** (Part 1).
“Cashier limit reached. Ask the owner to add a seat.”	All seats are in use.	The owner buys a **POS cashier seat**.

Message	What it means	What to do
“Counter is not available right now. Try again in a moment.”	The service could not confirm the add-on.	Wait, then reload.
“Couldn’t reach the server. Try again.”	No connection to the server.	Check the internet and try again.

Flowchart: set up a device

Test checklist: set up a device

#	What you do	What you should see	If you see something else
1	Open `/pos` on a fresh browser.	**Set up this counter** with **Mobile number** and a greyed-out **Send OTP**.	A cashier screen means the browser was already set up. Use a private window.
2	Type 9 digits.	**Send OTP** stays greyed out.	If it is active, report it.
3	Type a valid number and choose **Send OTP**.	The screen asks for **Enter the 6-digit OTP** and shows **Send again in Ns**.	Capture any error text.

#	What you do	What you should see	If you see something else
4	Enter a wrong code.	“Wrong OTP. Check and try again.”	A different message: note it.
5	Choose **Use email instead**.	**Email**, **Password** and **Sign in** appear. **Use phone instead** returns to the phone step.	
6	Finish sign-in, name the device and pick or add a counter.	A counter already in use shows **In use on another device**.	If a busy counter can be picked, report it.
7	Choose **Set up this counter**.	**Waiting for approval**, or **Who is billing?** if the device is approved already.	A blank screen or an error: capture it.

2.3 Approve devices, sign out a counter, open POS from Admin

What it’s for. The owner’s control over which devices can sell.

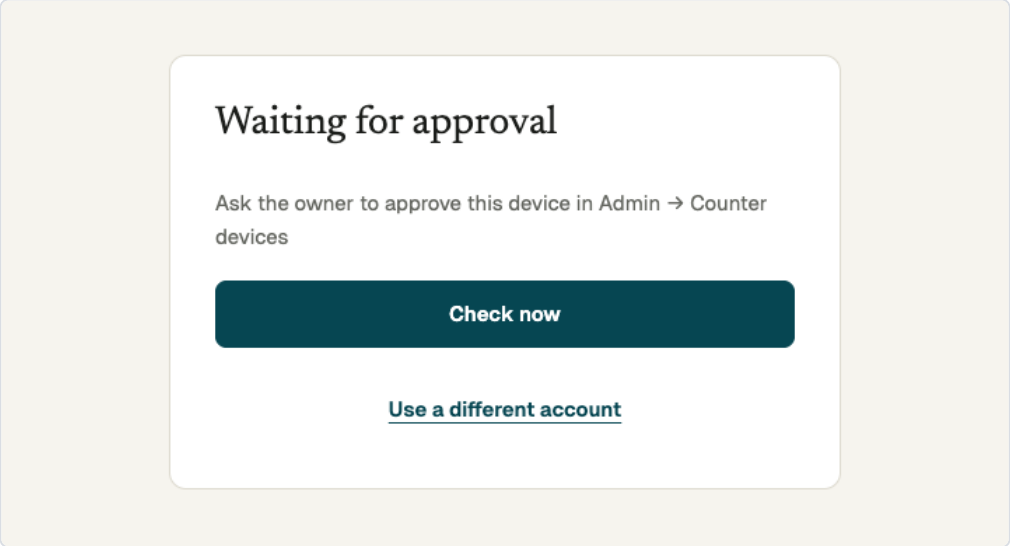

Who uses it. The owner.

Nav path: Admin → **Counter devices** → **Counter devices** (`/counter/devices`).

The waiting screen

After section 2.2 an unapproved device shows **Waiting for approval**. It checks again every five seconds on its own. **Check now** checks at once. **Use a different account** goes back to set-up.

The waiting screen says “Ask the owner to approve this device in Admin → Counter devices”. In Admin the owner opens **Counter devices** → **Counter devices**.

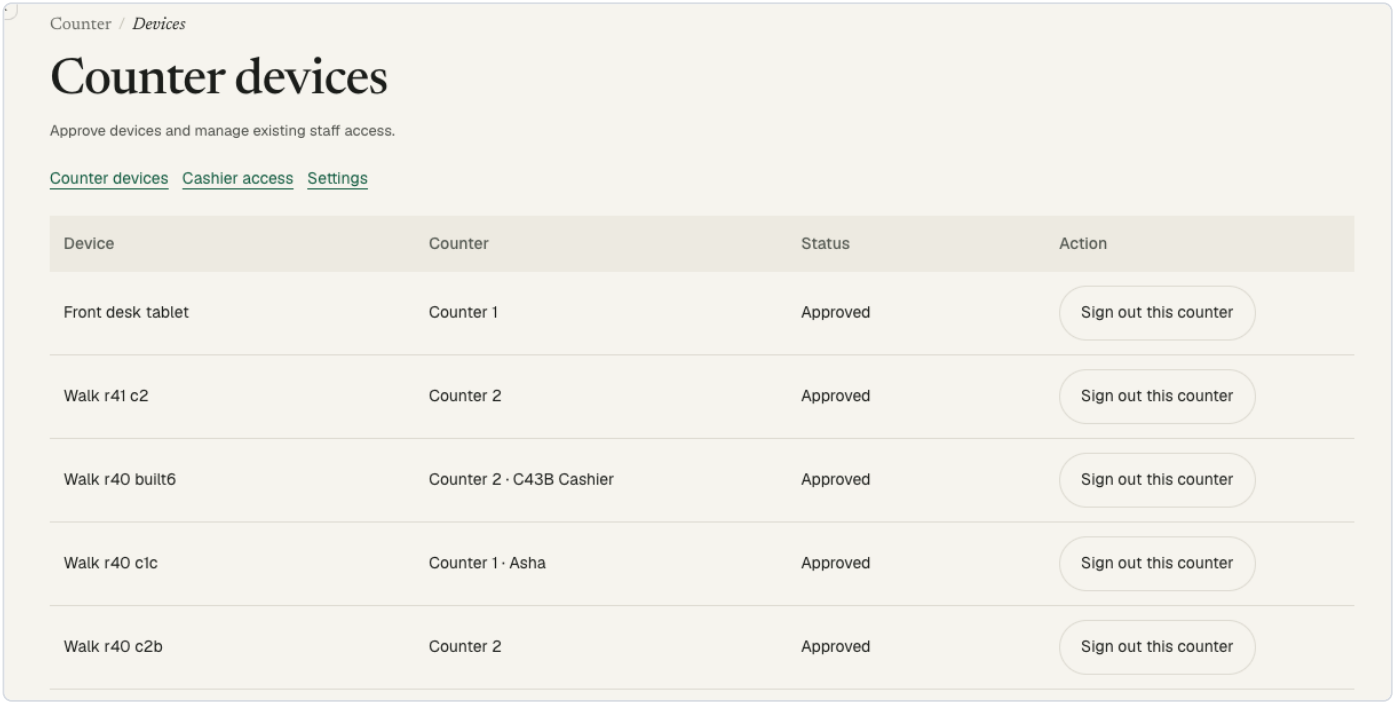

"Waiting for approval" card with Check now and Use a different account

The Counter devices page

A table with the columns **Device**, **Counter**, **Status** and **Action**.

Status	Meaning
Needs approval	The device asked to join and cannot sell yet. Approve it.
Approved	The device can sell.
Access removed	The device was removed (signed out, or rejected while it waited). It cannot sell and cannot be approved again.

A device whose sign-in has run out shows **Expired - reconnect needed**. The device must be set up again.

Admin Counter devices page with the device table and statuses

Open POS on this device (set up and approve in one step)

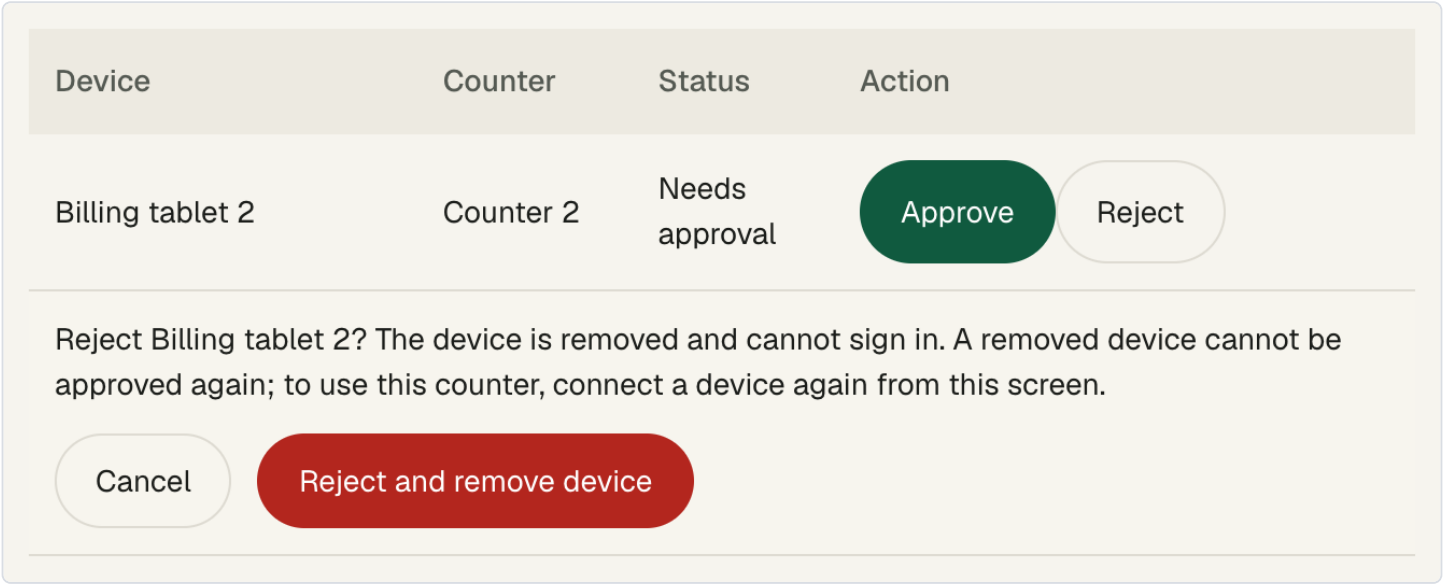

1. In Admin choose **Counter devices → Counter devices**.
2. Choose **Open POS on this device**.
3. Fill in **Device name** and **Counter**.
4. Choose **Approve and open POS**. The page confirms “Device approved.” and opens the counter window.

Reject a device waiting for approval

Use this when a row says **Needs approval** and you do not recognise the device, for example someone ran **Set up this counter** on the wrong tablet.

1. On **Counter devices → Counter devices** find the row whose **Status** is **Needs approval**. Only those rows have a **Reject** button, beside **Approve**. You need permission to manage counter devices.
2. Choose **Reject**. A confirmation opens under the row: “Reject (device name)? The device is removed and cannot sign in. A removed device cannot be approved again; to use this counter, connect a device again from this screen.”
3. Choose **Reject and remove device** (the red button). The page shows “Device rejected. Its access was removed.” **Cancel** closes the confirmation and changes nothing.

The row now reads **Access removed** and has no buttons. The rejected device drops back to **Set up this counter** the next time it checks or reloads, and it cannot sign in. If you rejected it by mistake, set the device up again from **Set up this counter** and approve the new request.

Counter devices page: a Needs approval row with Approve and Reject, and the red Reject and remove device confirmation open under it

Sign out a counter (remove a device)

1. On the Counter devices page find the device and choose **Sign out this counter**.
2. Read the confirmation and choose **Sign out and remove device**.
3. The page shows “Counter signed out. The device was removed.”

The device now shows **Access removed**. On the device itself the counter shows “This device was removed by the owner.” The owner can use this to free a counter that a cashier left signed in somewhere else.

Flowchart: approving and removing

Test checklist: devices

#	What you do	What you should see	If you see something else
1	After section 2.2 without owner approval, look at the device.	**Waiting for approval**.	If it opens the counter, check whether the account was the owner's.
2	In Admin open **Counter devices → Counter devices**.	The new device with status **Needs approval**.	Not listed: refresh the page and confirm the same store.
3	Approve the device. Watch the device for five seconds.	The device moves to **Who is billing?** on its own.	Still waiting after a minute: choose **Check now**.
4	Choose **Sign out this counter** and confirm with **Sign out and remove device**.	"Counter signed out. The device was removed." Status **Access removed**.	An error: capture the message.
5	Reload the removed device.	"This device was removed by the owner." and no way to sell.	If it still sells, report it.
6	Choose **Open POS on this device**, fill the fields and choose **Approve and open POS**.	"Device approved." and the counter window opens.	
7	Set up a second device and leave it waiting. On its row choose **Reject**, then **Cancel**.	The confirmation opens and closes. The row is still **Needs approval**.	The device removed on **Cancel**: report it.
8	On the same row choose **Reject**, then **Reject and remove device**.	"Device rejected. Its access was removed." The row reads **Access removed** with no buttons.	**Approve** still offered on the row: report it.
9	Reload the rejected device.	It returns to **Set up this counter** and cannot sign in.	It still reaches **Who is billing?**: report it.

2.4 Cashier access and PINs

What it's for. Deciding who can sign in at the counter, giving each person a PIN, and moving or restoring a cashier seat.

Who uses it. The owner, or an admin whose role can manage cashiers.

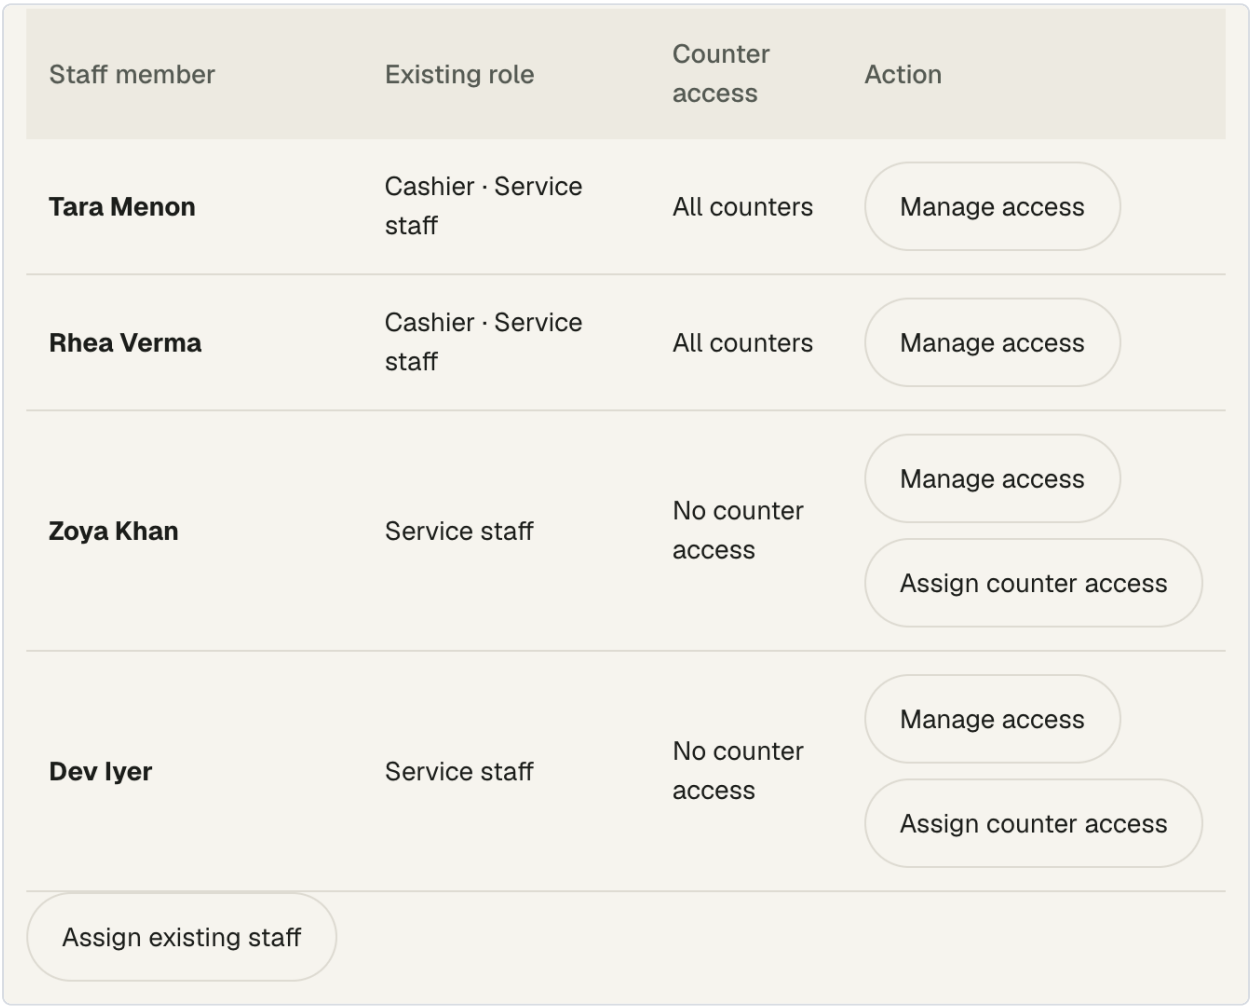

Nav path: Admin → **Counter devices** → **Cashier access** (`/counter/cashiers`).

Counter access is store-wide. Once a person has it, they can sign in on any approved counter with their own PIN. Giving access here does not create a second staff record: the person keeps the same name, appointments and commission history.

What the page shows

- A seat count such as "N of M cashier seats used", and a line under it such as "Included: N · Purchased: N · Owner uses no seat". When the split is not available the line says "Included and purchased seat counts are not available right now. Owner uses no seat." That is not an error.
- A staff table with the columns **Staff member**, **Existing role**, **Counter access** and **Action**. Every team member has a row.

Counter access shows	Meaning	Buttons in Action
No counter access	The person has never had counter access.	**Manage access**, and **Assign counter access** when the person can be assigned
All counters	The person can sign in on any approved counter.	**Manage access**
A counter name, for example **Counter 2**	An older cashier tied to one counter.	**Manage access**
Counter access disabled	The sign-in was switched off, for example by a seat transfer. The PIN and history are kept.	**Restore counter access**
No cashier seat used	The owner.	**Manage access**

Cashier access staff table: All counters rows with Manage access, No counter access rows with Manage access and Assign counter access (the two buttons stack at this window width), and the Assign existing staff button under the table

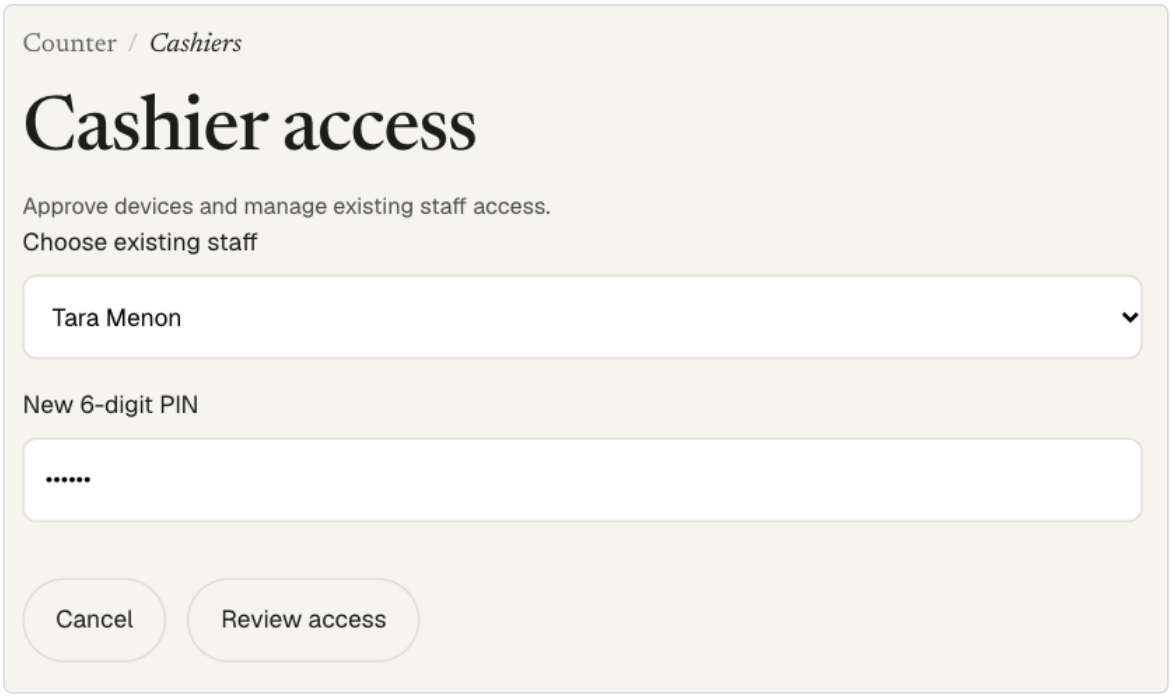

On a wide screen the two buttons in a row sit side by side. On a narrower window they stack, as in the picture.

Step by step: assign an existing staff member to the counters

The person must already be in your team list. A person who was never added to your team cannot be assigned here.

1. Open **Counter devices → Cashier access**.
2. Find the person. A row that reads **No counter access** has an **Assign counter access** button. Choose it, and the form opens with that person already picked. To start from the form instead, choose **Assign existing staff** under the table and pick the person from **Choose existing staff**.
3. Type a **New 6-digit PIN**. It is exactly six digits, shown as dots. It cannot be all one digit or a straight run, and no other cashier may already use it.

4. Choose **Review access**. The button stays greyed out until a person and a six-digit PIN are filled in.
5. The form turns read-only and says “Confirm counter access for (name). Existing identity and history stay intact.” Choose **Confirm access** to save, or **Edit** to go back and change something. **Cancel** leaves without saving.
6. The page shows “Counter access updated. Staff identity and history are kept.” and returns to the table. The person’s **Counter access** now reads **All counters**.
7. Give the PIN to the person in private. They pick their name on the counter’s **Who is billing?** screen and type it (section 2.5).

The assign form with Choose existing staff, a masked New 6-digit PIN, Cancel and Review access

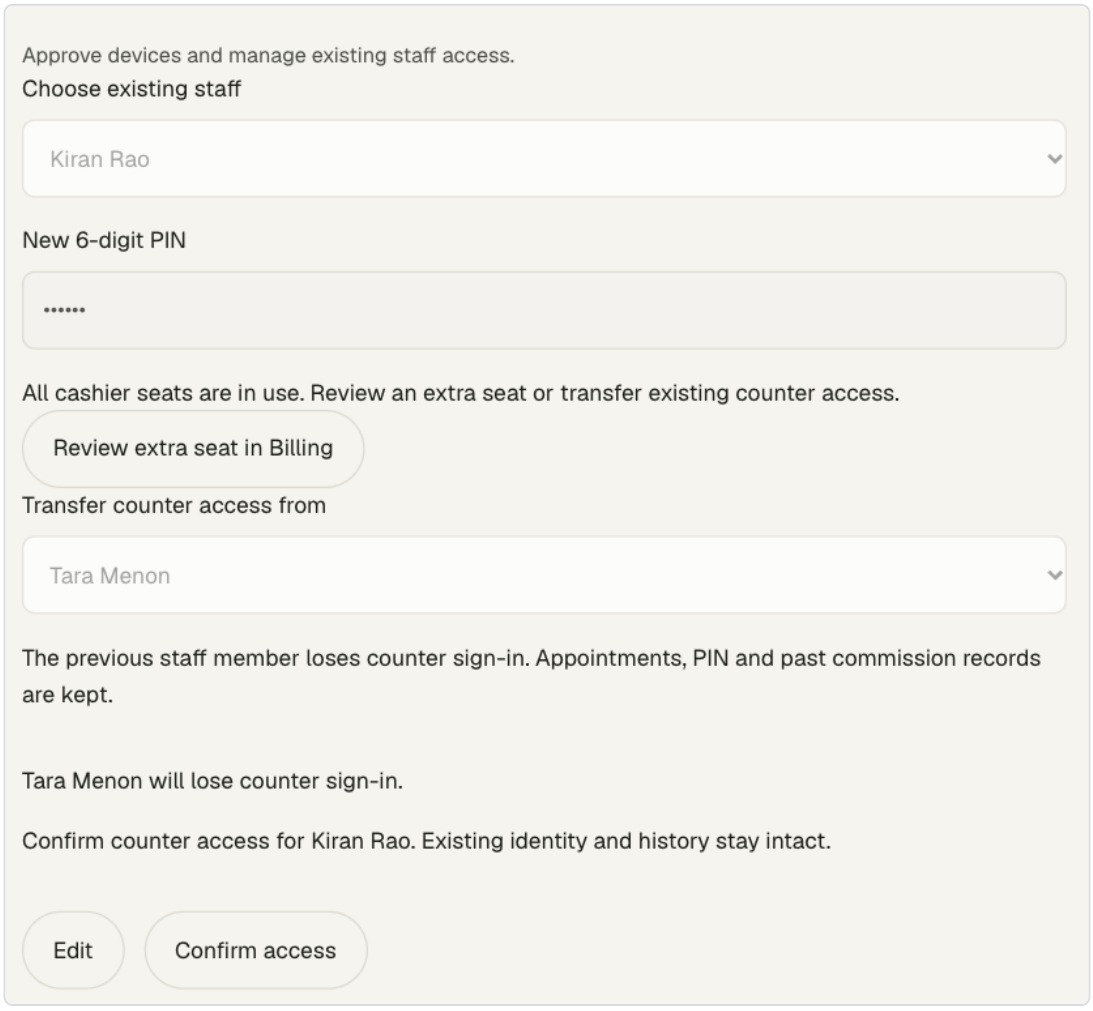

```
Cashier access
     |
row "No counter access"  ---  "Assign counter access"
or "Assign existing staff" under the table
     |
Choose existing staff + New 6-digit PIN
     |
seats free?  --yes-->  Review access --> Confirm access --> "All counters"
     |
     no
     |
Transfer counter access from (pick a holder)  or  extra seat in Billing
     |
Review access --> Confirm access --> new person "All counters",
                                     previous person "Counter access disabled"
```

When all cashier seats are in use

If every seat is taken, the form adds a message, “All cashier seats are in use. Review an extra seat or transfer existing counter access.”, and two ways forward:

- **Review extra seat in Billing** opens Billing so you can buy another seat. Come back and assign again.
- **Transfer counter access from** lists the people who hold a seat now. Pick one. The note under the list reads “The previous staff member loses counter sign-in. Appointments, PIN and past commission records are kept.” **Review access** stays greyed out until you pick someone.

On the review step the form adds a second line naming the person who loses access, for example “(name) will lose counter sign-in.” Choose **Confirm access** and the seat moves in one save: the new person gets access and the previous person is switched off. If the save fails, neither changes.

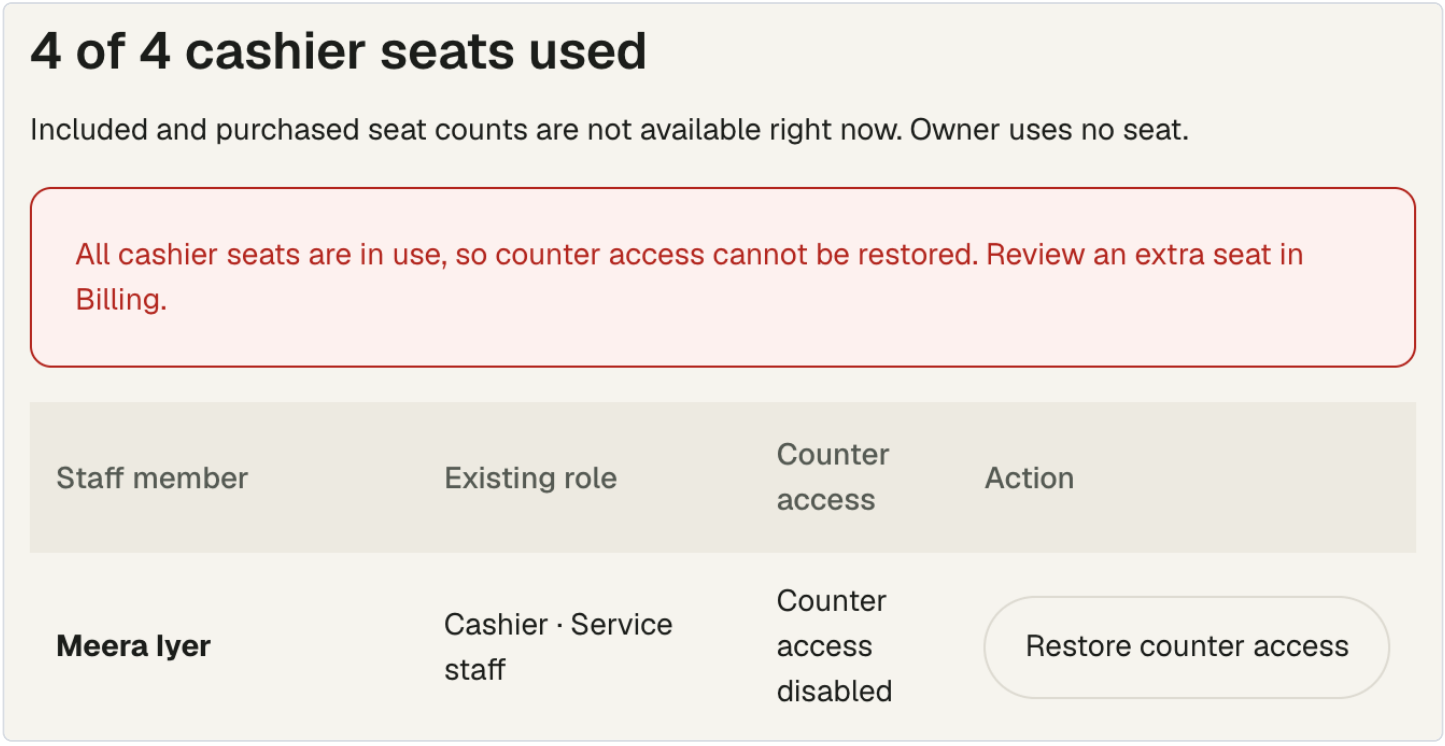

Assign form on the review step with seats full: the transfer warning, the line naming who loses counter sign-in, and Edit and Confirm access

Restore counter access

A person whose access was switched off (the previous holder after a transfer, or a cashier paused when the plan had fewer seats) shows **Counter access disabled** and a **Restore counter access** button in place of **Manage access**. Their PIN and history were never removed, so they need no new PIN.

1. Find the row that reads **Counter access disabled**.
2. Choose **Restore counter access**. There is no confirmation step.
3. The page shows “Counter access restored.” and the row reads **All counters**. The seat count goes up by one. The person signs in with their existing PIN.

If every seat is in use, the restore is refused and a red message appears above the table: “All cashier seats are in use, so counter access cannot be restored. Review an extra seat in Billing.” Add a seat in Billing, then choose **Restore counter access** again. The assign form cannot hand a seat back to this person, because it lists only people with no counter access at all.

Cashier access with 4 of 4 seats used and the red message All cashier seats are in use, so counter access cannot be restored

If the form refuses

The form stays open, shows a red message and refreshes the list.

You see	What to do
All cashier seats are in use now. Choose whose counter access to transfer, or review an extra seat in Billing.	Someone used the last seat while the form was open. Pick a person under **Transfer counter access from**, or add a seat.
Another cashier already uses this PIN. Choose a different 6-digit PIN.	Type another PIN.
That PIN is too easy to guess. Use 6 digits that are not all the same or in a straight run.	Choose a less predictable PIN.
This staff member can no longer be given counter access. The list was refreshed. Choose again.	The person was given access elsewhere, deactivated or removed. Choose again.
That cashier's counter access can no longer be transferred. The list was refreshed. Choose again.	The person you picked to transfer from changed. Choose again.
You do not have permission to change counter access. Ask the store owner.	Your admin role cannot manage cashiers.
The counter add-on is not active, so counter access cannot be assigned. Review it in Billing.	The add-on is off or has lapsed.
Counter access was not changed. Check the details and try again.	Any other failure. Nothing was saved. Reload and repeat.

Troubleshooting: why is Assign missing or greyed out?

What you see	Why
Assign existing staff is greyed out, with "Assigning counter access is not available right now. Check that the counter add-on is active and that you can manage cashiers. Existing cashier access is unchanged." under it	The POS add-on is not active, or your admin role has no permission to manage cashiers. Fix the add-on in Billing, or ask the store owner.
A row says **No counter access** but has no **Assign counter access** button	The same two causes, or the person is not one the form offers: they are inactive in your team list, or they are the owner (the owner signs in without a seat).

What you see	Why
A person is missing from **Choose existing staff**	They already have counter access (look for their row), they are inactive, or they are the owner. If every active person already has access, the form says “Every active staff member already has counter access. Add a staff member first, or manage an existing one from the list.”
A cashier row has **Restore counter access** but no **Manage access**	Their sign-in was switched off. Choose **Restore counter access**.
Manage staff PIN is greyed out for a person	They have never had counter access, so there is no cashier login yet. Assign counter access first.

Step by step: set or change a PIN

1. On **Cashier access**, find the person and choose **Manage access**.
2. Choose **Manage staff PIN**, or **Reset staff PIN** if they already have one.
3. Enter a **New 6-digit PIN** and save.
4. Give the PIN to the person privately.

A PIN is exactly 6 digits. There is no “Forgot PIN?” link on the counter. Only the owner can reset a PIN, from this page.

Edge cases

- Your seats cap how many cashiers can have counter access. Buy a **POS cashier seat** if you need more people (Part 1).
- If the number of seats is reduced, the newest cashiers are locked first. They show a **Locked** padlock on the sign-in screen. Adding seats back restores the oldest locked cashiers first.
- A switched-off cashier sees “This cashier has been switched off. Ask the owner.”

Test checklist: cashier access

#	What you do	What you should see	If you see something else
1	Open **Cashier access**.	Seat count and “Owner uses no seat”.	A missing breakdown: capture the page.

#	What you do	What you should see	If you see something else
2	Find a person whose **Counter access** reads **No counter access**. Choose **Assign counter access**, type a 6-digit PIN, choose **Review access** then **Confirm access**.	"Counter access updated. Staff identity and history are kept." The row reads **All counters**.	**Assign counter access** missing: check the add-on and your permission (see the troubleshooting table above).
2a	Open **Assign existing staff** with every seat in use.	The seats-full message, **Review extra seat in Billing**, and **Transfer counter access from**. **Review access** is greyed out until you pick a holder.	No seats-full message at 4 of 4: report it.
2b	Pick a holder and choose **Review access**.	A line names the person who will lose counter sign-in. After **Confirm access** that person reads **Counter access disabled** with **Restore counter access**.	The previous person still reads **All counters**: report it.
2c	With seats full, choose **Restore counter access** on a disabled row.	A red message: "All cashier seats are in use, so counter access cannot be restored. Review an extra seat in Billing." The row does not change.	The restore succeeds with no free seat: report it.
3	Set a PIN with **Manage staff PIN**.	The page confirms.	Try a 5-digit PIN: it should be refused.
4	Reduce seats by one.	The newest cashier is locked.	If the oldest is locked, report it.

2.5 Signing in with a PIN

What it's for. Telling the counter who is billing, so every bill is tied to a person.

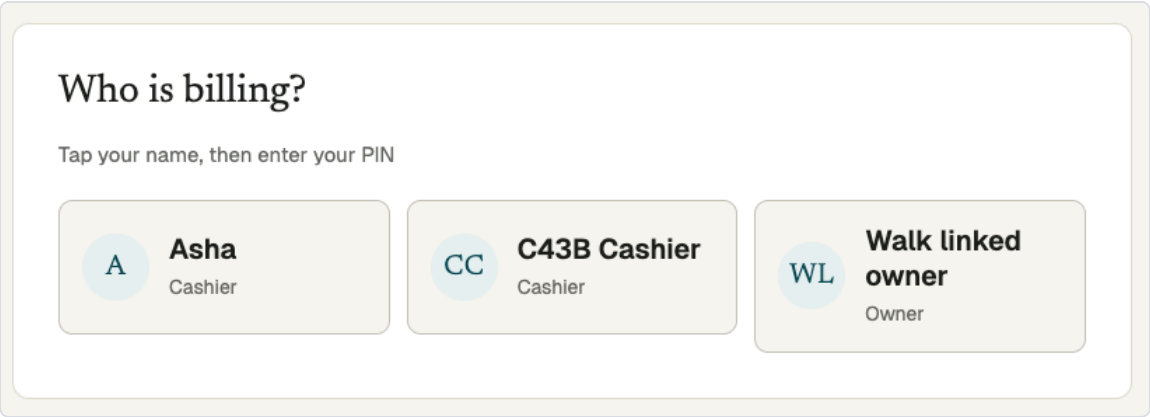

Who uses it. Counter staff.

The sign-in screen

The screen has a teal top bar with the BillionBiz logo, the **counter name** (hidden on a phone), a **Back to Admin** button (an arrow on a phone) and a language picker (a globe with a two-letter code). The card says **Who is billing?** and **Tap your name, then enter your PIN**.

Each staff member has a tile with their initials, name and role label (**Owner**, **Manager**, **Cashier** or **Order taker**). A tile with a padlock and **Locked** cannot be tapped.

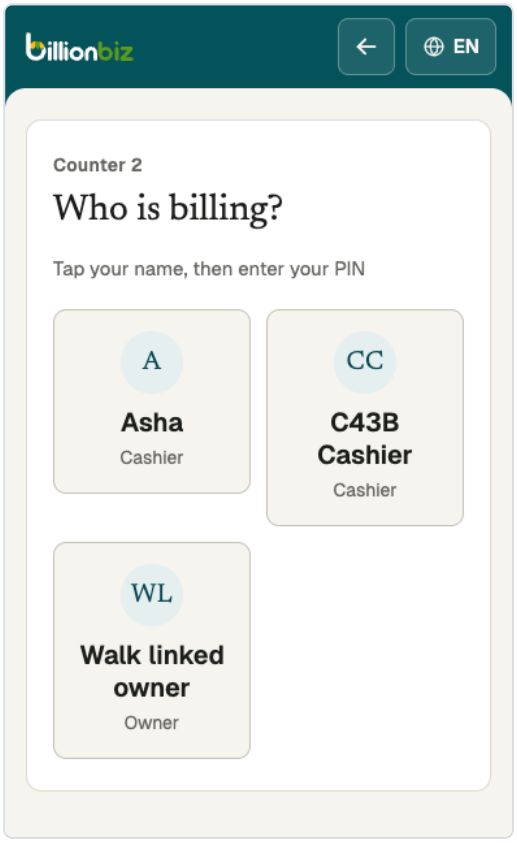

If nobody has been added yet, the screen says “No cashiers set up yet. Add them in Admin → Counter devices → Cashier access”.

"Who is billing?" with three staff tiles, Back to Admin and the language picker

Step by step

1. Tap your name.
2. The card changes to **your name · Enter your PIN** with six dots and a number pad.
3. Tap your six digits. The sixth digit signs you in on its own. **Continue** does the same thing with the six digits shown. **Delete** removes the last digit.
4. **Back** returns to the tiles.

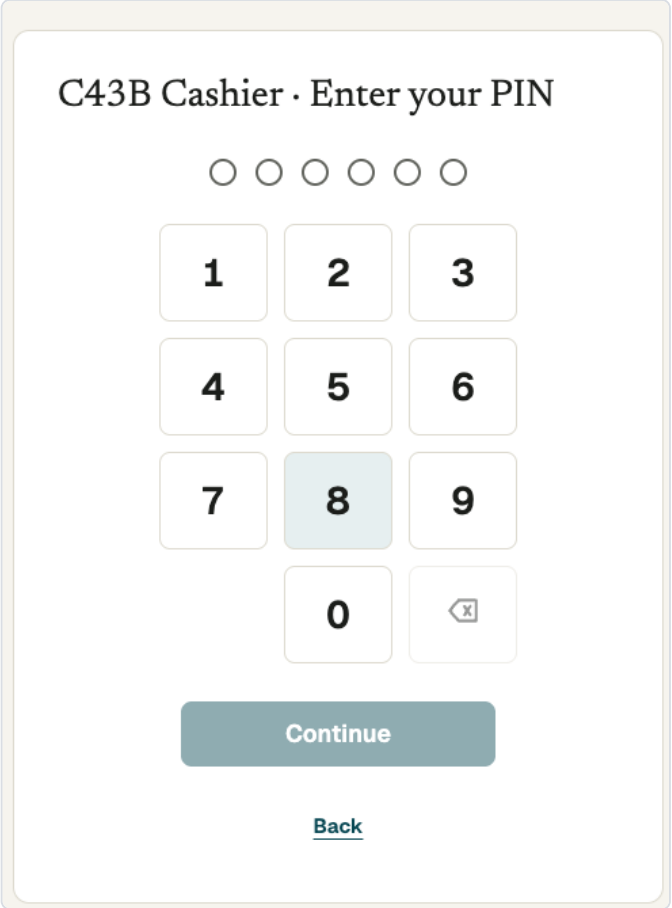

The same screen on a phone (390 px wide): arrow back and EN language button

Wrong PIN and lock-out

- A wrong PIN shows “Wrong PIN. N tries left”.
- After too many wrong tries, the cashier is locked for a while: “PIN locked. Try again in time”. The owner can also reset the PIN (section 2.4).

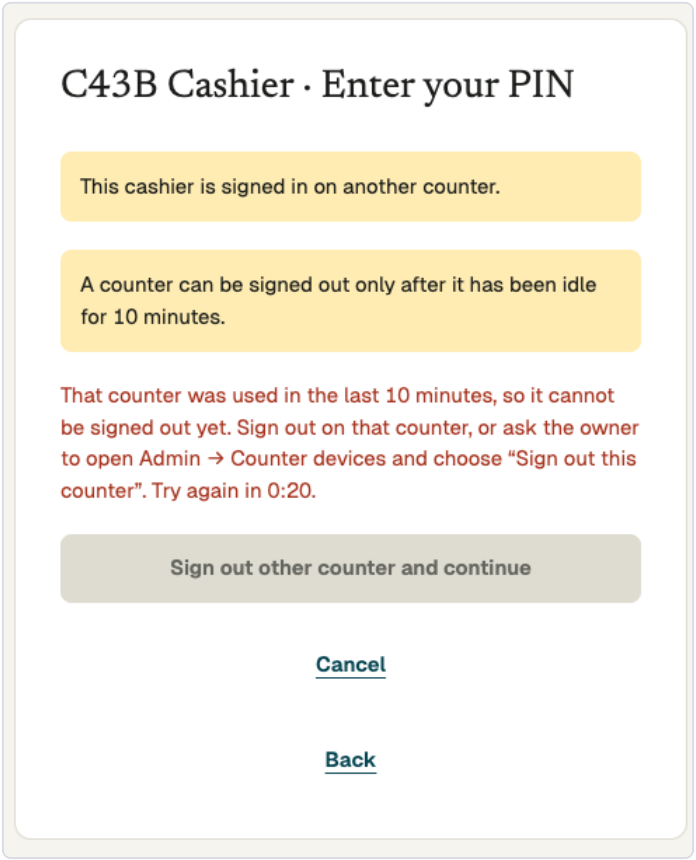

A cashier already signed in elsewhere

If the same cashier is signed in on another counter, the card says “This cashier is signed in on another counter.” and “A counter can be signed out only after it has been idle for 10 minutes.” Choose **Sign out other counter and continue** to take over.

The PIN card: six dots, number pad with a Delete key, Continue and Back

If the other counter was used in the last 10 minutes, the sign-out is refused: “That counter was used in the last 10 minutes, so it cannot be signed out yet. Sign out on that counter, or ask the owner to open Admin → Counter devices and choose”Sign out this counter”. Try again in 0:20.” The button stays greyed out until the countdown ends (60 seconds after a refusal). **Cancel** and **Back** leave the screen.

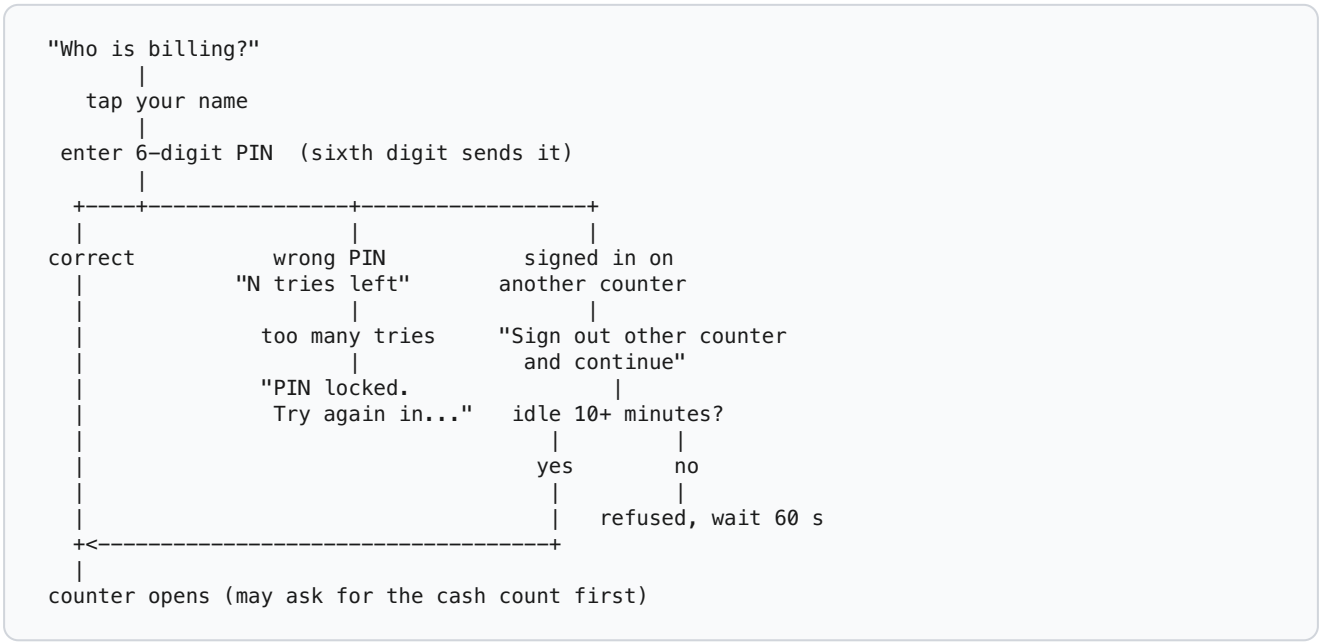

Takeover refused: yellow notices, red explanation with a countdown, greyed button, Cancel and Back

If the list will not load

If the staff list cannot be loaded, the screen says “Couldn’t reach the server. Try again.” with a retry button. Check the internet connection and retry.

Flowchart: sign in

Test checklist: sign in

#	What you do	What you should see	If you see something else
1	Open `/pos` on an approved device.	**Who is billing?** with one tile per assigned staff member, each with role label.	A missing person: check Cashier access and seats.
2	Tap a cashier and enter their PIN.	Six dots fill and the counter opens on the sixth digit.	If nothing happens, try **Continue**. Report both outcomes.
3	Enter a wrong PIN.	“Wrong PIN. 4 tries left” (or the right count).	A different wording: capture it.
4	Keep entering wrong PINs.	The cashier is locked: “PIN locked. Try again in time”.	If the count never runs out, report it.
5	Sign the same cashier in on two devices.	The second shows the sign-out question. A quick take-over is refused with a countdown.	If the second device signs in without waiting, report it.
6	After 10 idle minutes on the first device, try the take-over again.	**Sign out other counter and continue** works.	A refusal after 10 minutes: capture the time.
7	Stop the server, then reload the sign-in page.	“Couldn’t reach the server. Try again.”	

2.6 Lock, switch staff and the idle lock

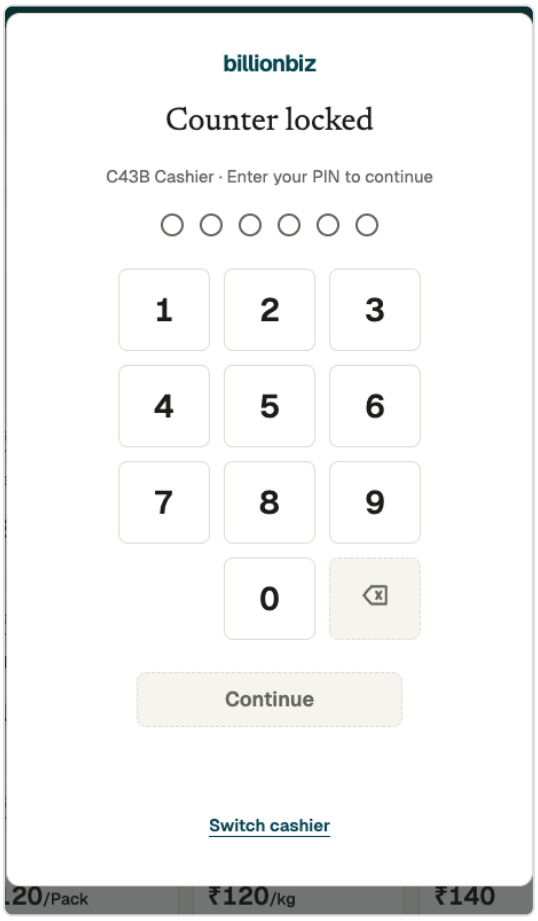

What it’s for. Keeping the till safe while you step away, and changing who is billing.

Who uses it. Counter staff.

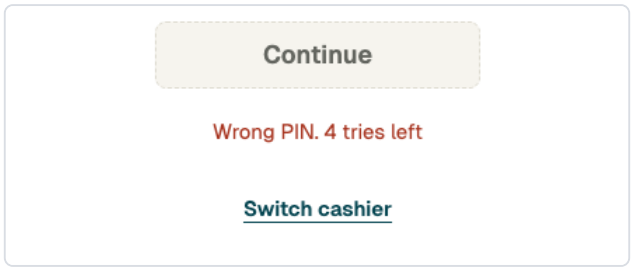

Step by step

1. Choose **Lock** at the bottom of the left rail.
2. The counter shows **Counter locked** and “name · Enter your PIN to continue”.
3. Enter the PIN to carry on. A wrong PIN shows the same “Wrong PIN. N tries left” message.
4. To let someone else sign in, choose **Switch cashier**.

The bill you were ringing up stays saved on the device.

Counter locked: six dots, number pad, Continue and Switch cashier

Counter locked after a wrong PIN: "Wrong PIN. 4 tries left"

Automatic locks

When	What happens
No activity for 10 minutes	The counter locks itself.
The tab or app was hidden for more than 60 seconds	The counter locks when you come back.

If bills are waiting to be sent after an internet drop, the lock screen says so (“N bill(s) waiting. Enter your PIN to send it/them.”). Signing in sends them. After sending, it may show “N bill sent, receipt pending.”

The top bar status

The top bar shows the sync state, the date and time, and “cashier name · role”:

Chip	Meaning
“Synced” with a time	Everything is saved on the server.
“Connecting…”	Checking the connection.
“Offline · N bill(s) waiting”	No connection. Bills are saved on the device (Part 6).
“Syncing · N bill(s) waiting”	Sending saved bills.
“Needs attention · N bill(s) waiting”	Some bills did not send. Open the offline details (Part 6).

The “Saved data may be removed.” banner

Some browsers may clear a counter’s saved data. When the browser does not promise to keep it, the counter shows “Saved data may be removed.” under the top bar. Use the close button to hide it. Bills waiting offline live in this saved data, so do not clear browser data while bills are waiting.

Test checklist: lock

#	What you do	What you should see	If you see something else
1	Add an item to the bill and choose **Lock**.	**Counter locked** covers the screen.	If you can still tap items, report it.

#	What you do	What you should see	If you see something else
2	Enter the PIN.	The counter returns with the bill intact.	A cleared bill: report it.
3	Lock and enter a wrong PIN.	“Wrong PIN. N tries left”.	
4	Lock and choose **Switch cashier**.	Another person can sign in.	
5	Leave the counter untouched for 10 minutes.	It locks itself.	If it never locks, report it.
6	Switch to another tab for over a minute, then come back.	The counter is locked.	

2.7 Exit POS and go back to Admin

What it’s for. Leaving the counter window for the Admin Panel without leaving a till open to anyone.

Who uses it. The owner or any staff member.

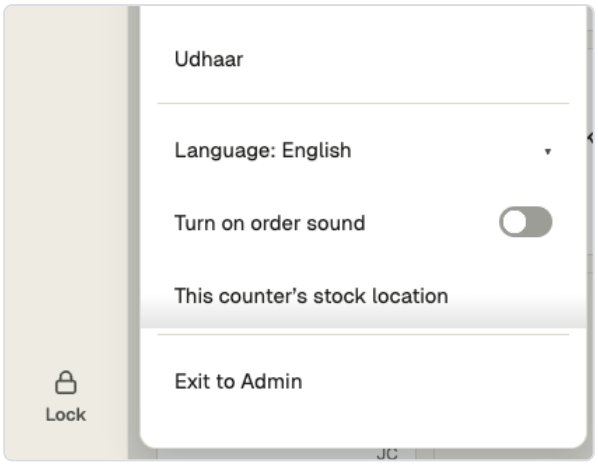

Two ways out

Where	Control	When to use it
Counter sign-in screens	**Back to Admin** in the top bar	Before signing in.
Signed in	**More** (left rail) then **Exit to Admin** at the bottom of the panel	After signing in.

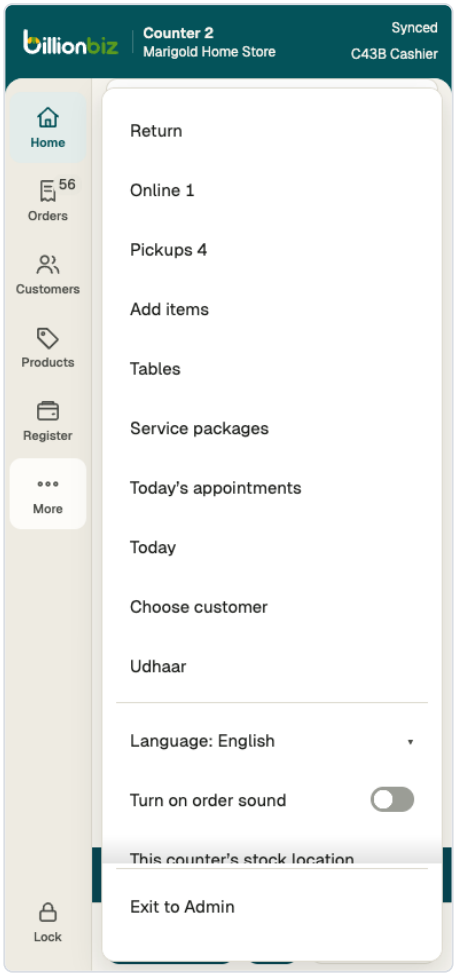

Step by step: from the More panel

1. Choose **More** in the left rail.
2. Choose **Exit to Admin** at the bottom of the panel, under a divider.
3. If the bill is empty and nothing is waiting to send, you leave at once.
4. If the bill has items, or bills are waiting to send, a dialog asks **Leave the counter?** It says:
    - “The bill you are ringing up stays saved on this device. Sign in with your PIN to carry on.”
    - “The counter locks. Your register stays open.”

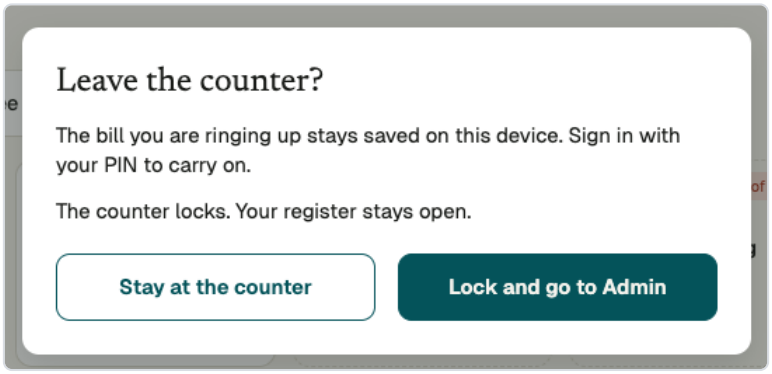

5. Choose **Lock and go to Admin** to leave, or **Stay at the counter** (also Esc) to stay.

The More panel with Exit to Admin pinned at the bottom

The More panel on a phone (390 px wide) with Exit to Admin at the bottom

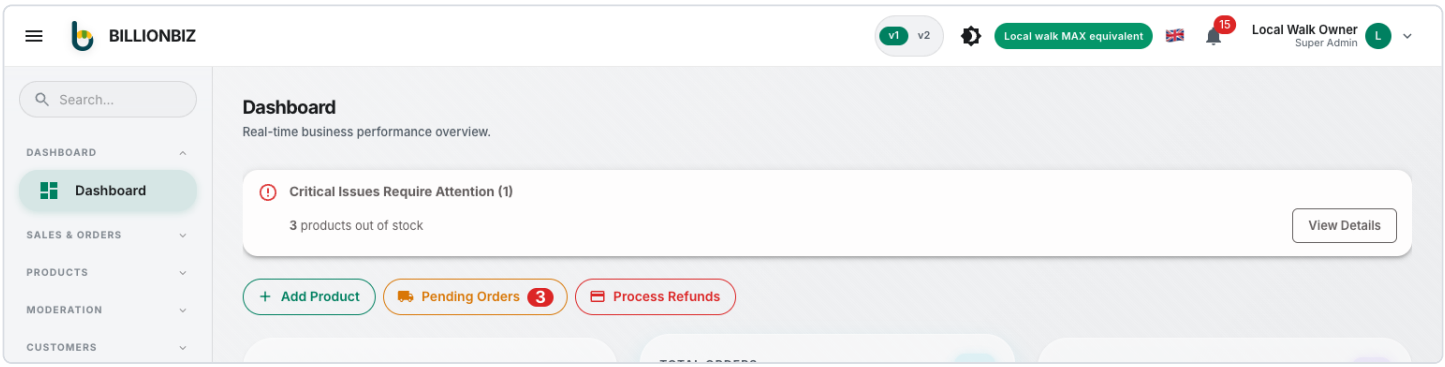

The "Leave the counter?" dialog with Stay at the counter and Lock and go to Admin

Where you land

The counter goes back to the Admin page you came from. If it cannot tell, it opens the Admin dashboard (`/dashboard`).

What stays and what does not

- The counter locks. The next person signs in with their PIN.
- The register stays open and the day is not closed.
- The bill you were ringing up stays saved on this device.
- Bills waiting to send stay on the device and send when the counter is open again.
- There is no “Continue as admin” option. To work in Admin, use **Lock and go to Admin**.

The Admin dashboard after leaving the counter

Flowchart: exit

Test checklist: exit

#	What you do	What you should see	If you see something else
1	With an empty bill, choose **More → Exit to Admin**.	You leave at once to Admin.	A dialog with an empty bill and nothing waiting: report it.
2	Add an item, then choose **Exit to Admin**.	**Leave the counter?** with both buttons.	If you leave with no dialog, report it.
3	Choose **Stay at the counter**.	The dialog closes and the bill is intact.	
4	Choose **Exit to Admin** then **Lock and go to Admin**.	Admin opens.	
5	Go back to `/pos`.	The counter shows the PIN sign-in. After signing in, the item is still on the bill and the register is still open.	A lost bill: report it.
6	On a sign-in screen choose **Back to Admin**.	Admin opens.	

2.8 When the add-on or subscription lapses

What it's for. What staff and the owner see if the POS add-on ends or was never bought.

Who uses it. Everyone.

What the counter does

- A banner says "Counter add-on has ended. You can still see bills and undo."

- You can still look at past bills and undo where allowed.
- The editing controls are switched off. Anything that would change a sale is refused with the same wording.

What Admin shows

State	Message
Lapsed	“Counter sales are paused. Past bills and obligations remain available.”
Never bought	“The counter add-on is not active. Other payment flows remain available.”

How to fix it

The owner renews or buys the POS add-on from **Settings → Billing & Plan → Add-ons** (Part 1). Selling resumes once the add-on is active again. Reload the counter if it still shows the banner.

Test checklist: lapse

#	What you do	What you should see	If you see something else
1	On a store whose POS add-on has ended, open the counter and sign in.	The banner “Counter add-on has ended. You can still see bills and undo.” and no way to start a sale.	If a sale can be started, report it.
2	Open **Counter devices** in Admin.	“Counter sales are paused. Past bills and obligations remain available.”	
3	Open a past bill.	It opens and can be viewed.	A blocked past bill: report it.
4	Renew the add-on and reload the counter.	Selling works again.	

2.9 The v2 counter layout in one glance

The counter now uses one look on every screen.

Area	What it is
Top bar (teal)	Logo, counter name and store name, sync chip, date and time, and “cashier name · role”. On a phone the bar is shorter.
Left rail	**Home**, **Orders** (with a number badge), **Customers**, **Products**, **Register**, then **More**, with **Lock** at the bottom.
Work area (cream)	Search, **Scan with camera**, **Beep on scan**, shortcut tiles, categories and the item grid. The current bill sits on the right on a desktop. On a phone it is a bar at the bottom with **Cash** and **Other ways to pay**.
More panel	Return, Online, Pickups, Add items, Tables, Service packages, Today’s appointments, Today, Choose customer, Udhaar, then Language, order sound and the counter’s stock location, then **Exit to Admin**. The list shown here is from the test store. Entries can differ by store and pack.

2.10 Troubleshooting: devices and sign-in

Problem	Likely reason	What to do
“Set up this counter” shows again after it worked.	The browser’s saved data was cleared, or the owner removed the device.	Set the device up again.
Stuck on **Waiting for approval**.	The owner has not approved it.	Open **Counter devices** → **Counter devices** in Admin and approve it. Then choose **Check now**.
A person is missing from **Who is billing?**	They are not assigned, have no seat, or their seat was locked.	Check **Cashier access**.

Problem	Likely reason	What to do
A person's tile shows **Locked**.	Their seat is locked (seats were reduced).	The owner adds seats back, or frees a seat.
"This cashier is signed in on another counter."	The cashier is signed in elsewhere.	Sign out there, wait for 10 idle minutes, or the owner uses **Sign out this counter**.

Problem	Likely reason	What to do
"This device's access has expired. Set it up again."	Device access ran out.	Repeat section 2.2.
"Counter add-on has ended."	The add-on lapsed.	Renew it in **Billing & Plan → Add-ons**.
Nothing happens when the sixth PIN digit is typed.	The device may be offline or the page is still loading.	Choose **Continue**, or check the connection.

Part 3 — Counter billing and tenders

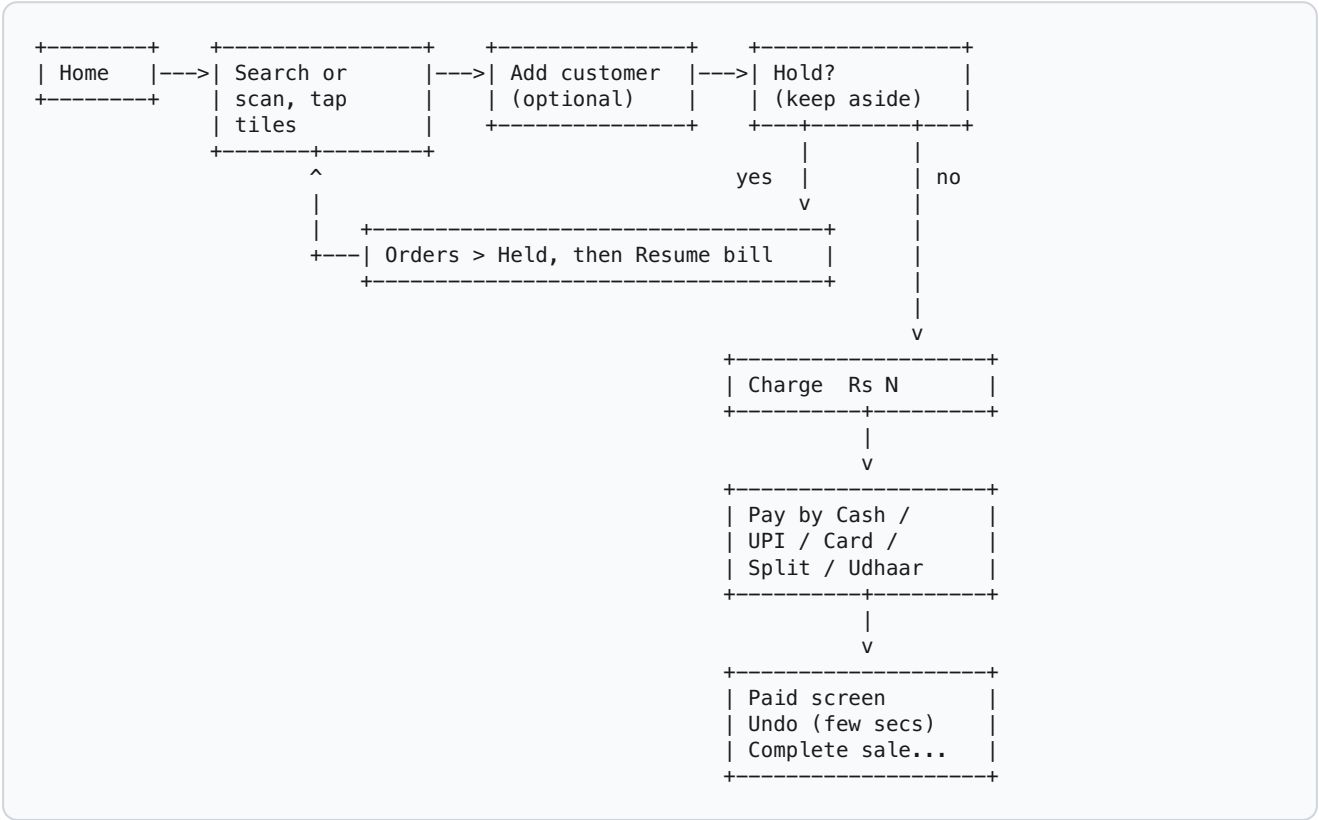

This part follows one sale from the first item to the **Paid** screen. It covers the everyday counter at `/pos`: building a bill, quantities, discounts, putting a customer on the bill, holding a bill, and taking payment by cash, UPI, card or a split. Restaurant tables are in Part 4. Returns, voids and receipts after the sale are in Part 5.

Wording on the screens is exact in this guide. If a QA tester sees different words, that is a finding.

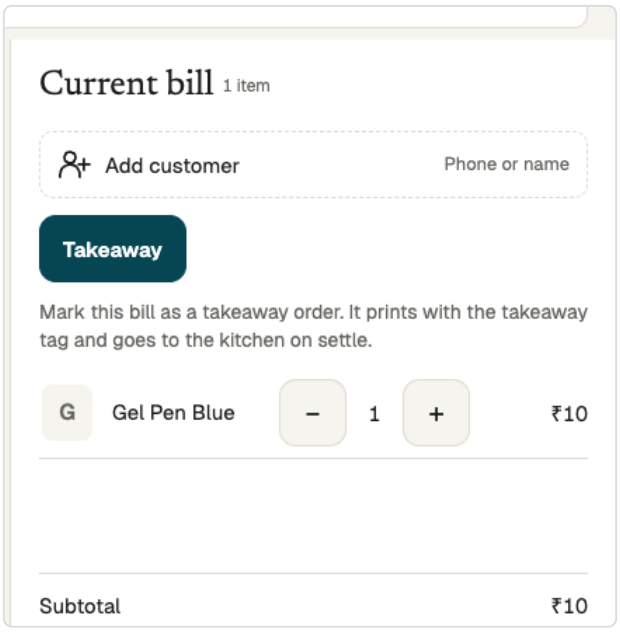

3.1 The sale at a glance

What it's for: a single picture of the sale before the detail.

Who uses it: cashiers, owners, and QA.

Behind the scenes: the bill lives on the counter until it is paid or kept aside. Nothing is final until a payment is recorded. After payment the bill gets a bill number (for example Bill 1230) and the **Paid** screen opens.

The counter home with one item on the Current bill. The Takeaway button (shown here pressed) only appears on a restaurant store.

3.2 Building the bill

What it's for: putting the right items, quantities and customer on the bill before you ask for money.

Who uses it: the cashier at the counter, on a desktop or tablet (wide layout) or a phone (the bill opens as a drawer).

Step by step

1. Sign in to the counter. You land on **Home**: the item tiles are on the left and **Current bill** is on the right. A new bill starts as soon as you add the first item (the empty bill says **Tap an item to start a bill**).
2. To find an item, either tap its tile, or type in **Search or scan** (name, short code or barcode). **Scan with camera** opens the phone or tablet camera. **Beep on scan** turns the scan sound on or off.
3. If the item has variants (size, colour), a chooser opens first. Pick the variant, then it is added.
4. Change the quantity with the minus and plus buttons on the bill line. A quantity of zero removes the line. **Undo last item** removes the item you added most recently.

5. For something that is not in the catalogue, tap **Open item**. Enter the name and the amount on the keypad. This is for one-off items. It does not create a product.
6. To add a customer, tap **Add customer** (shows **Phone or name**). Search by name or phone and choose the person. The customer card opens on the right of the bill. See 3.5.
7. The bill shows **Subtotal**, then **Discount** (only if one is applied), then **Total**. On bills with tax lines you also see the GST and **Round off** lines (see 3.9).

What you will see

Where	What it means
Current bill and a count such as **1 item**	The bill in progress.
Out of stock badge on a tile	The product has no stock and is not set to sell when out of stock.
Charge · ₹N at the bottom	The amount you are about to collect. It stays disabled until the bill has at least one item.

Edge cases and what is blocked

- If a product is out of stock, the counter refuses it with **Out of stock. This product isn't set to sell when out of stock.** (the message names the item). The owner can allow selling past zero with the per-product **Keep selling when out of stock** setting. Ask the owner; the cashier cannot override it.
- While a payment is being taken, item buttons and the Takeaway button are locked so the bill cannot change under the payment.
- **Hold** and **Discount** are disabled on an empty bill, with a short line under them saying they need at least one item.

Test checklist

#	What you do	What you should see	If you see something else
1	Tap one in-stock tile.	The item appears under **Current bill** with quantity 1 and the right price. **Charge · ₹N** shows the same amount.	Wrong price or no line: note the item, price, and counter.
2	Tap plus on the line.	Quantity 2, total doubles.	Total not updated: capture the bill.
3	Tap **Undo last item**.	The most recent item or quantity step is removed.	Nothing happens: log it.

#	What you do	What you should see	If you see something else
4	Tap a tile marked **Out of stock**.	The item is not added. A message explains the stock refusal.	Item added anyway: check whether the product has **Keep selling when out of stock** turned on.
5	Tap **Open item**, enter an amount, add it.	A line appears with the amount you typed.	Line missing: log it.
6	With an empty bill look at **Hold** and **Discount**.	Both disabled, with a line saying they need at least one item.	Enabled on an empty bill: log it.

3.3 Discounts

What it's for: reducing the bill for a reason you can name.

Who uses it: cashiers (within their limit) and the owner (any amount).

Step by step

1. With at least one item on the bill, tap **Discount**.
2. Choose how to enter it: a percentage or a rupee **Amount**. Shortcuts for 5%, 10%, ₹10 and ₹50 are offered.
3. Pick a reason. The list shows the owner's saved reason buttons in saved order, then **Other** last (the owner manages the buttons in section 1.4, Discounts tab). A store with none saved shows Regular customer, Bulk purchase, Damaged item, Festival offer and Staff.
4. Apply. The bill now shows a **Discount** line and the new **Total**. **Charge** shows the discounted amount.

Edge cases

- Every cashier has a discount limit set by the owner. If you go over it, the sheet tells you the limit and offers **Reduce discount to N%**. To go above the limit, the owner approves with their PIN on the spot.
- If the owner has switched discounts off for this counter or cashier, the bill shows a note that discounts are off and **Discount** cannot be used.

Test checklist

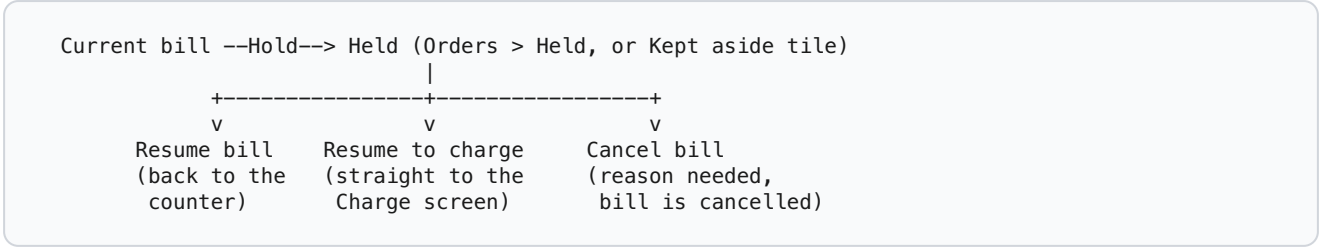

#	What you do	What you should see	If you see something else
1	Tap **Discount**, choose 10%, choose a reason, apply.	A **Discount** line and a lower **Total** and **Charge**.	Total unchanged: log it.

#	What you do	What you should see	If you see something else
2	Enter a discount larger than the cashier limit.	The limit notice and **Reduce discount to N%**.	Discount accepted with no approval: log it with the cashier name.
3	Apply the owner PIN when asked.	The bigger discount is accepted.	Refused with a correct PIN: log it.
4	In Admin **POS settings**, rename a reason button and save; open **Discount** at the counter again.	The renamed reason, in saved order, with **Other** last.	Old or fixed list shown: log it.
5	Pick **Other**, leave the box empty.	**Apply discount** stays disabled until a reason is typed.	Applied with no reason: log it.

3.4 Holding (parking) a bill

What it's for: a customer steps away, or you need to serve someone else first. The bill is kept, with its items, customer and discount.

Who uses it: cashiers.

Step by step

1. On a bill with items, tap **Hold**. The bill is kept aside and the counter starts fresh.
2. To find it again, open **Orders** and choose the **Held** tab, or tap the **Kept aside (N)** tile on Home. The tab shows the number of held bills.
3. Select the bill. The right side shows its items and **Payable**.
4. Choose one of:
   - **Resume bill**: opens it on the counter so you can add more.
   - **Resume to charge**: opens it directly on the Charge screen.
   - **Cancel bill**: asks **Cancel this held bill?**. A reason is required. Confirm with **Yes, cancel bill** or back out with **Keep bill**.
5. **Back to counter** returns to Home.

Statuses

What you see	Meaning
Held tab with a count	Bills kept aside, not paid. Each row reads like **Bill 1255 · 3 items**. The item count adds up units: a line with quantity 2 reads **2 items**, and a weighed, measured or fractional-quantity line counts as 1.
Today tab	Bills paid today (see Part 5 for voided bills). Today rows show no item count.
Pickups tab	Online pickup orders (not counter bills).

Edge cases

- A held bill is not a sale. It does not touch stock reports or the register until it is paid.
- A restaurant bill whose kitchen ticket has already been sent cannot be cancelled from **Held**. The counter says the kitchen already has the order. See Part 4.
- A bill saved as Takeaway stays Takeaway when resumed. See Part 4.

Test checklist

#	What you do	What you should see	If you see something else
1	Add two items, tap **Hold**.	The counter clears. **Kept aside** and the **Held** count go up by one.	Bill vanished with no held entry: log it.
2	Open **Orders** > **Held**, select the bill.	Items and **Payable** match what you held.	Different items: log it.
3	Tap **Resume bill**.	The same items are back on the counter.	Items missing: log it.
4	Hold again, tap **Cancel bill**, confirm without a reason.	A reason is required.	Cancelled with no reason: log it.
5	Cancel with a reason.	The bill leaves **Held**.	Still listed: log it.
6	Hold a bill with one item at quantity 2 and a second line that is weighed (or measured). Open **Orders** > **Held**.	The row reads **3 items** (2 units plus 1 for the weighed line).	**2 items**, or a count such as **2.375 items**: log it.
7	Open **Orders** > **Today**.	Paid rows show customer, bill number, time and total, with no item count.	An item count on a Today row: log it.

3.5 Putting a customer on the bill

What it's for: linking the sale to a customer so the bill, receipt, loyalty and udhaar (credit) go to the right person.

Who uses it: cashiers.

Step by step

1. On the bill, tap **Add customer** (or **Choose customer** on the Charge screen).
2. Search by name or phone. Recent customers are offered. Select the customer.
3. The customer's name replaces the dashed **Add customer** box. You can change it until payment.
4. To create a new customer or see their history, open **Customers** in the left menu (`/pos/customer`).

Edge cases

- An inactive customer is refused with a message that offers **continue as walk-in**.
- A locked customer is refused and asks the store owner to unlock it, or you can choose someone else or continue as walk-in.
- A bill with no customer is a walk-in sale. Cash, UPI and card all work without a customer. Udhaar needs a customer who the owner has approved (see 3.8).

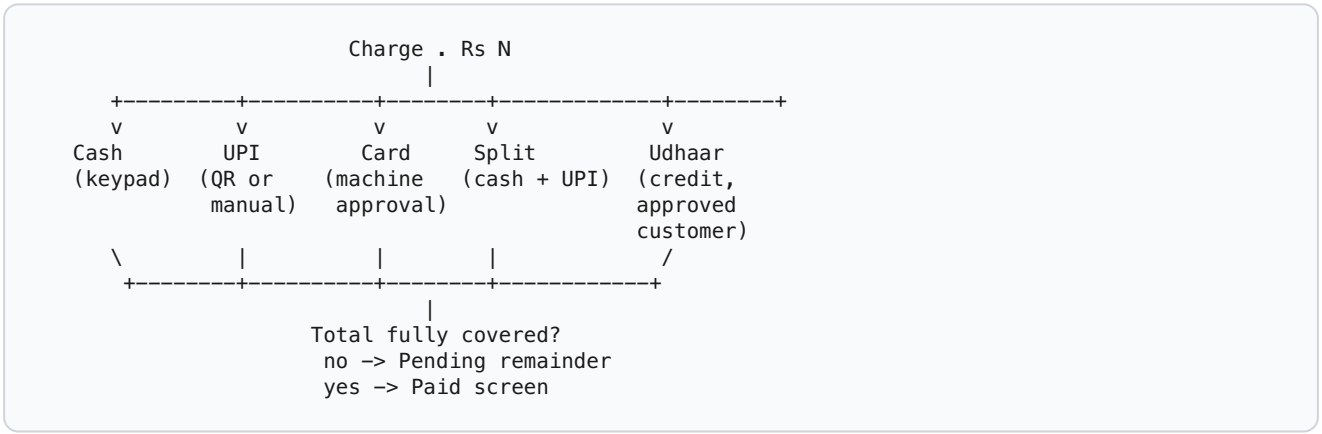

Test checklist

#	What you do	What you should see	If you see something else
1	Tap **Add customer**, search a known customer.	The customer is selectable and appears on the bill.	Customer not found: check spelling, then the owner's customer list.
2	Try an inactive customer.	A refusal that offers walk-in.	Customer accepted: log it.
3	Remove the customer and charge.	The sale completes as a walk-in.	Blocked without a customer on a cash sale: log it.

3.6 Taking payment: the Charge screen

What it's for: collecting the money and recording how it was paid.

Who uses it: cashiers.

Step by step

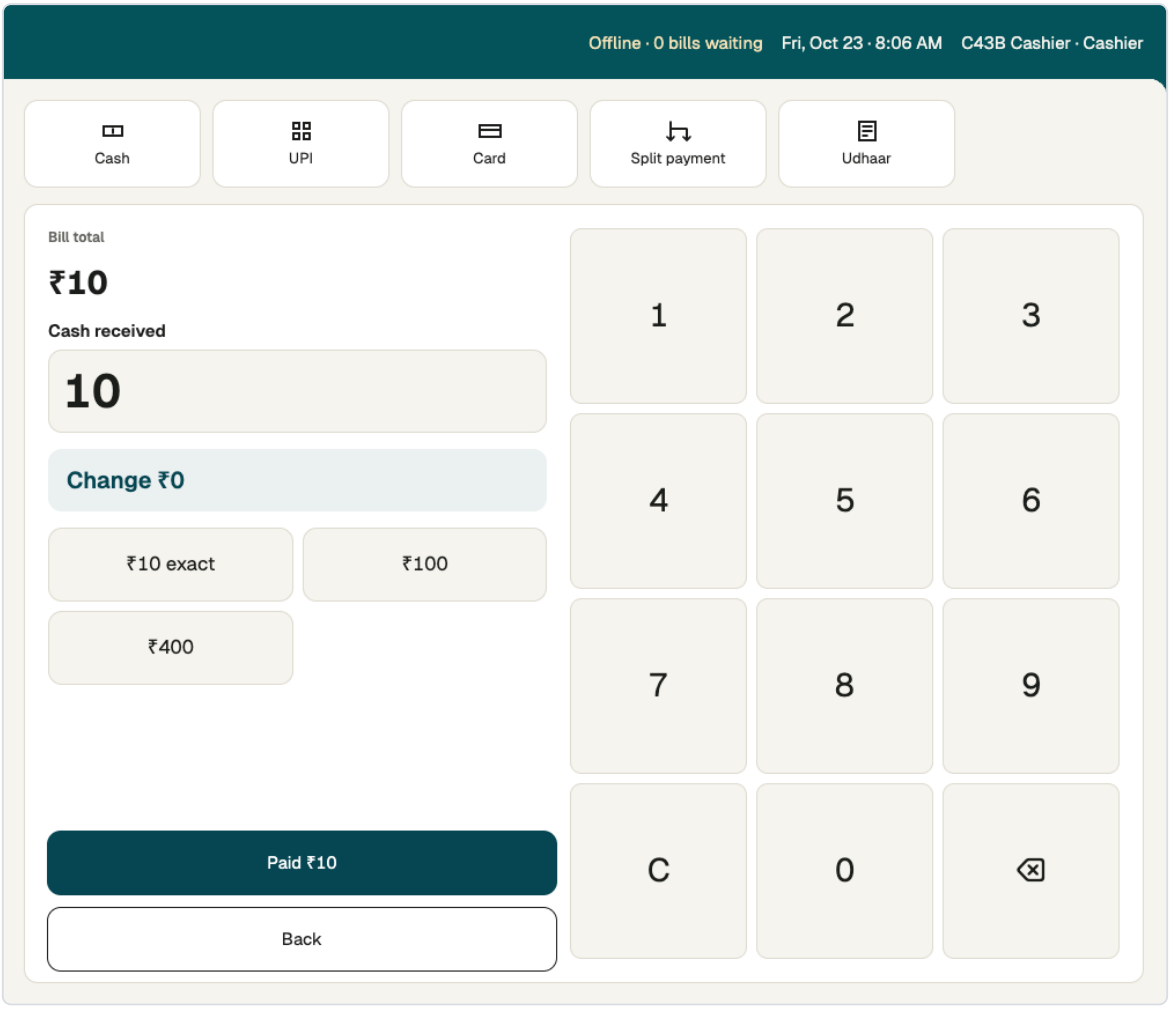

1. Tap **Charge · ₹N**. The Charge screen opens. The left side lists the items, **Choose customer**, **Payments on this bill** and the totals. The top row has **Cash**, **UPI**, **Card**, **Split payment** and **Udhaar**.
2. Pick a tender and follow 3.7. When the payment is recorded in full the **Paid** screen opens (3.10).
3. **Back** returns to the bill without charging.

On a phone the bill is a drawer. The main tenders are shown, and **Other ways to pay** lists UPI, Card, Split payment and Udhaar.

Edge cases

- While the total is not yet confirmed the button shows a dash instead of an amount. Wait for it to settle. Do not charge a dash.
- If the total is zero (for example a full discount), the button reads **Complete bill** and no tender is needed.

- **Payments on this bill** shows each payment with a status such as **Received**, **Pending remainder**, or **Card declined · no confirmed capture**. Only confirmed money counts towards the total.

The Charge screen with the Cash tab. This capture was taken with the counter offline (see the Offline strip at the top), which is why only cash is accepted. Online counters accept all five tenders.

3.7 The tenders, one by one

Cash, with change due

What it's for: the most common sale.

1. Tap **Cash**. **Cash received** is pre-filled with the exact amount (for example **₹10 exact**).
2. If the customer gave more, tap a note shortcut (for example ₹100 or ₹400) or type the amount on the keypad. **C** clears, the back-arrow key deletes one digit.
3. The **Change** line shows what to hand back. It stays at ₹0 for an exact payment.
4. Tap **Paid · ₹N**. The Paid screen opens with **Change to give** if there is any.

Cash less than the bill total leaves a remainder. The bill is not paid until the remainder is covered by another tender (see Split).

UPI

1. Tap **UPI**. The counter shows a QR for the amount, and the customer pays from their phone.
2. When the payment is confirmed it shows as **Received** under **Payments on this bill**, and the Paid screen opens.
3. To abandon the QR, use the cancel control on the QR panel. The bill stays open.

Manual UPI (fallback)

Use only when the QR cannot be used (the customer paid your own QR or number and you can see it in your bank app).

1. On the UPI panel choose the manual option. The panel is titled **Manual UPI fallback**.
2. Check your bank app, then tap **Received**. A reference is optional: the last 4 digits help the owner match it later.
3. If you cannot check right now, choose **Confirm later**. The bill is paid and the receipt says **Payment recorded — bank check pending**. The Paid screen button reads **Print**, not **Complete sale and print bill**, while the check is pending.
4. The owner reviews these under **UPI to check** in the owner register report (`/reports/pos-counter`).

Card

1. Tap **Card**. The panel is titled **Manual card payment**. Run the card on your own machine.
2. When the machine approves, tap **Approved on card machine · Record ₹N**. A **Last 4 digits or approval code** is optional.
3. If the machine declines, do not record it. The line shows **Card declined · no confirmed capture** and the bill stays unpaid.

Split payment (cash and manual UPI)

1. Tap **Split payment**.
2. Enter the **Cash part**. Tap **I have taken this cash** once the customer has handed it over.
3. The **Remaining** amount is shown. Tap **Take ₹N by UPI**, then record **Received** as in Manual UPI.

4. To abandon a split after cash was taken: tap **I have returned the cash to the customer**, then **Record cash returned**, so the register stays right.

Udhaar (credit)

1. Add the customer first. The customer must be one the owner approved for udhaar.
2. Tap **Udhaar**. Enter **Amount on udhaar**. If the customer pays part now, take it first and use **Collect remaining ₹N by** for the rest.
3. Tap **Give udhaar**. Above the customer's limit the owner approves with their PIN.
4. The balance is collected later at `/pos/khata` with **Collect**. The limit is set by the owner at `/settings/pos/khata-limit`.

Offline: cash only

If the counter has lost the internet (or the server is unreachable), the strip at the top reads **Offline · N bills waiting**. **Cash** works and the bill is saved on the device as a **Provisional receipt** (not a GST invoice). UPI and card are refused with: **UPI and card need a connection. Take cash, or wait until you're back online.** Manual UPI is not available offline (cash only). When the connection returns, waiting bills sync and receive their final numbers.

Test checklist

#	What you do	What you should see	If you see something else
1	Add a ₹10 item, **Charge**, **Cash**, leave the exact amount, tap **Paid · ₹10**.	**Paid** screen. **Change** was ₹0. Bill number shown.	Stuck on Charge: log it with the console message.
2	Same, but type ₹100 received.	**Change** shows ₹90. The Paid screen shows **Change to give**.	Wrong change: log amounts.
3	**Charge**, **UPI**, confirm the payment.	**Received** under **Payments on this bill**, then Paid.	Paid without confirmation: log it.
4	**Manual UPI fallback**, tap **Confirm later**.	Receipt says **Payment recorded — bank check pending**. Paid button reads **Print**.	Plain paid receipt: log it.
5	**Card**, record **Approved on card machine** with no code.	Paid. The Payments list shows Card.	Refusal because the code is empty: log it (the code is optional).
6	**Split payment**: cash part, **I have taken this cash**, then UPI for the rest.	**Remaining** reaches zero, then Paid. Both payments are listed.	Paid with a remainder: log it.
7	Go offline, take a cash sale.	**Provisional receipt**. **Offline · N bills waiting**.	Sale refused: log it.
8	Offline, try UPI or card.	The refusal sentence about needing a connection.	Accepted: log it. This is a defect.

#	What you do	What you should see	If you see something else
9	Customer with no udhaar approval, tap **Udhaar**.	Udhaar is refused or unavailable.	Accepted: log it.

3.8 Udhaar rules at a glance

Rule	What the counter does
Walk-in customer (no customer on the bill)	Udhaar is not offered.
Customer not approved for udhaar	Udhaar is not offered.
Amount above the customer's limit	Owner PIN approval is asked.
Part-paid	The part paid now is recorded as cash, UPI or card; only the rest is udhaar.
Paying it back	`/pos/khata` > **Collect**.

3.9 Money rules: tax lines and rounding

What it's for: so the numbers on the screen, the receipt and the register agree.

Line	Meaning
Subtotal	Sum of the lines before any bill discount.
Discount	The bill discount. Absent when none applied.
GST / GST included	Tax. Many stores show prices with GST included, so this line explains the tax inside the total instead of adding to it.
Round off	A small adjustment (a few paise) so the total is a whole rupee amount. It can be plus or minus.
Total / Payable	The amount the customer pays. On the receipt the same amount may read **Bill total**.

What to check:

- **Payable** on the Charge screen equals **Total** on the bill and the **Paid** receipt total.

- Change is computed from **Cash received** minus **Payable**, never from the subtotal.
- Stores without a GST invoice show **Bill of Supply** and **Not a GST invoice** on the receipt. The tax lines are then absent.

Test checklist

#	What you do	What you should see	If you see something else
1	Sell an item with paise in its price.	A **Round off** line that makes the **Payable** a whole rupee.	Payable with paise: log item and amount.
2	Compare the bill total, Charge, and Paid receipt.	The same amount in all three.	Different: log all three.
3	Check a GST store's bill.	**GST** or **GST included** shown, **Total** consistent.	Tax missing on a GST store: log it.

3.10 The Paid screen

What it's for: confirm the money, give change, and finish the sale (print or send the bill).

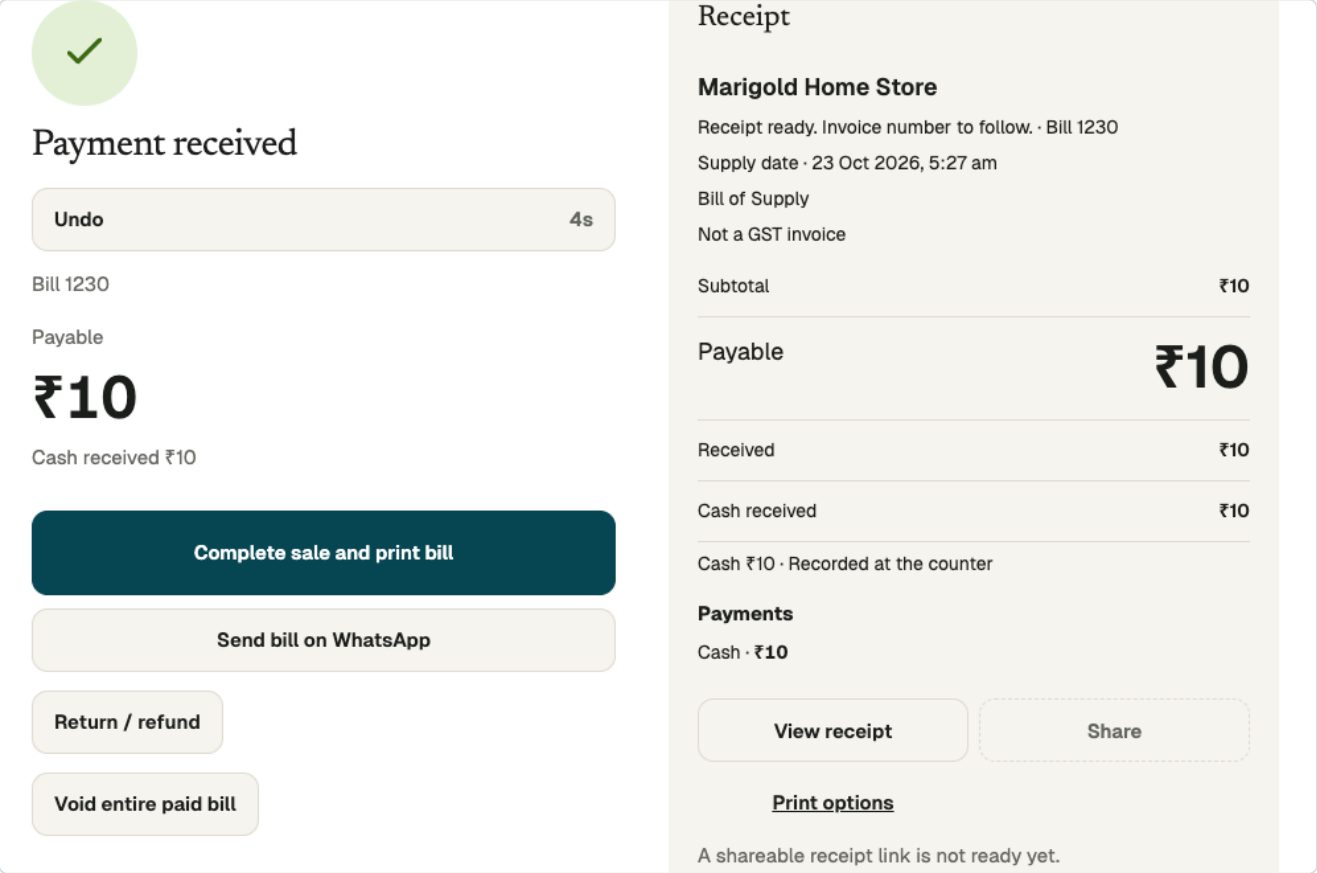

Who uses it: cashiers.

What you see

The title is **Paid** with the bill number (for example **Bill 1230**). The middle shows **Payment received**, **Payable** and **Cash received**. The left lists the items and **Payments on this bill**. The right is the **Receipt** panel: store name, **Receipt ready. Invoice number to follow.**, the supply date, **Bill of Supply** or the GST invoice lines, totals, and the **Payments** list (oldest first: Cash, UPI, Card).

Control	What it does
Undo with a countdown (for example 4s)	Reverses the sale in the first few seconds. After that it reads **Too late to undo. Use Returns** and you use a return or void (Part 5).
Complete sale and print bill	Prints and starts the next bill. It reads **Print** while a manual UPI check is pending.
Send bill on WhatsApp	Sends the bill to the customer's number.
Complete without receipt	Finishes without printing. Both completion buttons stay fixed at the bottom of the screen.

Control	What it does
Return / refund	Opens the return flow for this bill (Part 5).
Void entire paid bill	Cancels the whole sale and refunds it (Part 5).
View receipt, **Share**, **Print options**	Receipt tools. **Print options** chooses 58 mm or 80 mm paper, the receipt language, and **Document copy** Original or Duplicate.

The Paid screen for a cash sale: Payment received, Undo countdown, the completion buttons, and the Receipt panel on the right. The grey notice bar at the top is a browser-storage notice from the capture environment.

Edge cases

- A bill that was voided shows **This bill was voided. There is no receipt to print.** on its Paid screen.
- A bill that is not a GST invoice says **Bill of Supply** and **Not a GST invoice**.
- If the shareable receipt link is not ready yet the panel says **A shareable receipt link is not ready yet.** Try again after a moment.

Test checklist

#	What you do	What you should see	If you see something else
1	Finish a cash sale.	The **Paid** screen with **Payment received**, bill number, **Undo** countdown.	Different screen: log it.
2	Tap **Undo** during the countdown.	The sale is reversed and the bill returns to the counter.	Undo missing: log it with the seconds left.
3	Wait until the countdown ends.	**Undo** is gone or reads **Too late to undo. Use Returns**.	Undo still works much later: log it.
4	Tap **Complete without receipt**.	A fresh empty bill opens.	Stays on Paid: log it.
5	Tap **Print options**.	58 mm / 80 mm, language, Original / Duplicate.	Missing a choice: log it.

3.11 Troubleshooting

Question	Likely cause and what to do
Why is **Charge** greyed out?	The bill is empty, the total is unconfirmed (a dash shows), or the register is closed. Check for the **Counter closed** notice (Part 5).
Why is **Discount** or **Hold** disabled?	There is no item on the bill, or the owner has turned discounts off for this counter.
Why was UPI or card refused?	The counter is offline. Take cash, or wait for the connection.

Question	Likely cause and what to do
Why can’t I choose Udhaar?	There is no customer on the bill, or the owner has not approved this customer for udhaar.
Why does the Paid button say **Print**?	A manual UPI payment is waiting for the owner’s bank check.
Why does a product show **Out of stock**?	Its stock is zero and **Keep selling when out of stock** is off for that product.

Part 4 — Restaurant

This part covers the restaurant side of the counter: the **Tables** floor, dine-in orders on a table, the **Takeaway** switch, kitchen tickets (KOT), what happens when the kitchen does not confirm a ticket, and how guests order from a table by QR code. It applies to stores with the restaurant add-on active.

4.1 What turns the restaurant features on

What it's for: knowing why a store does or does not show the restaurant buttons.

Who uses it: owners setting up, QA checking a store.

You see	Because
A **Tables** button in the counter header	The store has the restaurant add-on active and the counter uses the restaurant menu-tile layout.
A **Takeaway** button next to the bill	The store has the restaurant add-on active (see the note below).
Neither	The restaurant add-on is not active for this store. Ask the owner to enable it.

Note for QA: on a store that has the restaurant add-on, the **Takeaway** button is shown on any counter of that store, including a retail-style counter. The planned behaviour "hidden on retail counters by default" is not what the current build does. This is recorded as an open question for the owner (see the open questions at the end of this part).

4.2 The Tables floor

What it's for: seeing every table at once, opening a table, and starting a new order.

Who uses it: waiters and the cashier.

Step by step

1. On the counter, tap **Tables** in the header. The **Tables** floor opens.
2. Find a table with **Table or bill ID** (search). Use the status filter (**All** and the other statuses) to narrow the floor.

3. Tap a free table to start its first order. Free tables are marked **Free**. Tables with an open bill show their bill and elapsed time. A table is shown in red after **Red time over 60 min**. **Table colours** explains the colours.
4. **New order** starts an order without a table. **Pick up** is for takeaway collection orders.
5. **Needs attention** lists tables where **Kitchen delivery needs checking.**
6. The counts at the top read **Open tables** and **Open bills**.

On a quiet floor you see **The floor is clear**, **Pick a free table to start its first order.** and **Start first order**.

Test checklist

#	What you do	What you should see	If you see something else
1	On a restaurant store tap **Tables**.	The floor with tables, **Free** labels, search and filter.	No **Tables** button: check the store has the restaurant add-on and the menu-tile counter.
2	Search a table name in **Table or bill ID**.	Only matching tables remain.	Search does nothing: log it.
3	Tap a free table.	The table order screen opens with an empty order.	Opens a different table: log both names.

4.3 Dine-in order on a table

What it's for: taking an order at a table, sending it to the kitchen in rounds, and settling the bill at the end.

Who uses it: waiters and the cashier.

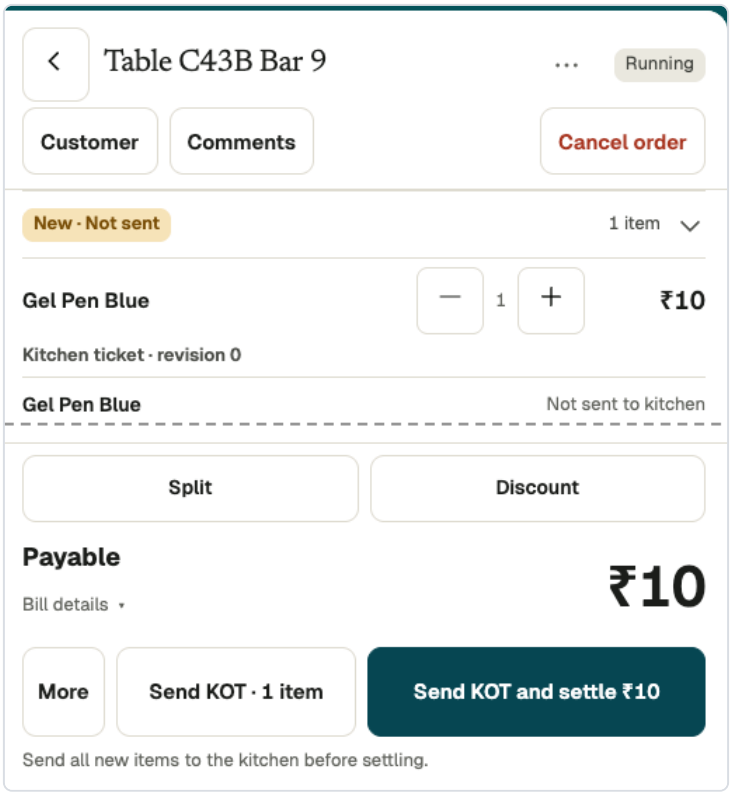

Step by step

1. Open the table. The header shows the table name and the status chip **Running**.
2. Add items from the menu. New lines are marked **New · Not sent** and **Not sent to kitchen**.

3. Optional: **Customer** to attach a customer, **Comments** for notes on the order, and item modifiers from **More**.
4. Tap **Send KOT · N items** (or **Send KOT · 1 item**). The new items become a kitchen ticket. Lines move to **Queued for kitchen**, then **Sent to kitchen**, and **Printed at kitchen** where a kitchen printer confirms.
5. Repeat for later rounds. Only new items go in each ticket.
6. Read the totals under **Bill details**: **Subtotal**, **Discount**, **GST included**, **Round off**, **Payable**. Use **Split** to divide the bill (**Number of bills (2–20)**, **Review split**, **Confirm**) and **Discount** for a bill discount.
7. When the guests are ready, tap **Settle ₹X**. Payment works as in Part 3 (cash, UPI, card, split, udhaar).
8. **Send KOT and settle ₹X** does both in one step when everything is new.
9. **More** opens **More order actions**: **Save and print bill**, **Save and send on WhatsApp**, **KOT and print bill**, **Save no KOT**, **Move to another table**, **Item modifiers**.
10. **Cancel order** cancels the whole order (a reason is asked).

Footer hints tell you what blocks settling: **Send all new items to the kitchen before settling.**, **Resolve kitchen delivery before settling.**, and **Add items to send a KOT or settle.**

A dine-in table order that has not been sent yet: items marked New · Not sent, Send KOT, Settle, and Bill details.

Statuses on a kitchen line

Label	Meaning
New · Not sent	Added, not yet in a ticket.
Queued for kitchen	Ticket created; waiting to be delivered.
Sent to kitchen	Delivered to the kitchen.
Printed at kitchen	The kitchen printer confirmed.
Kitchen delivery failed	The ticket did not reach the kitchen. See 4.5.

Test checklist

#	What you do	What you should see	If you see something else
1	Open a free table, add two items.	Both lines show **New · Not sent**. **Send KOT · 2 items** is enabled.	Button missing: log it.
2	Tap **Send KOT · 2 items**.	Lines move to **Sent to kitchen** (or **Queued for kitchen** then **Sent**).	Stuck on New: log it with the console message.
3	Add one more item and look at the footer.	**Send all new items to the kitchen before settling.**	Settle enabled with unsent items: log it.
4	Open **More**.	**More order actions** lists the options named above.	An option missing: log which.
5	Tap **Split**, choose 2 bills, **Review split**, **Confirm**.	Two bills are created with the items divided.	Split refused: capture the message.
6	Tap **Settle ₹X** and pay cash.	The **Paid** screen (Part 3).	Settle disabled with everything sent: see 4.5.

4.4 The Takeaway switch

What it's for: marking a bill as a takeaway order so it prints with a takeaway tag and goes to the kitchen when paid.

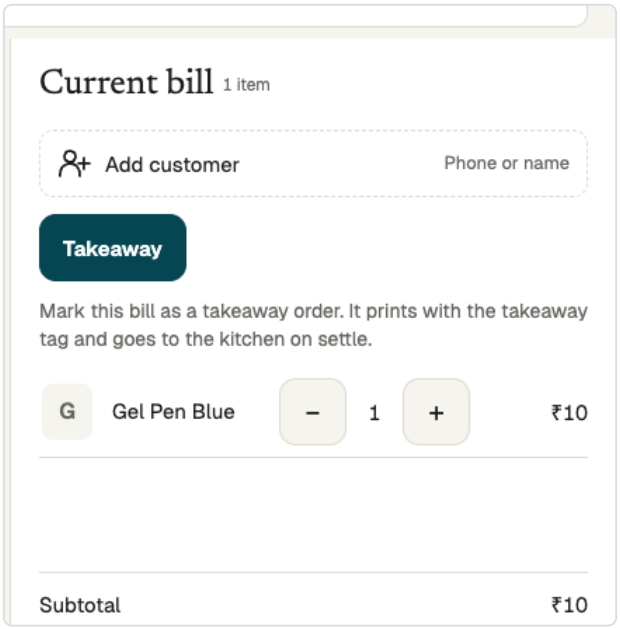

Who uses it: the cashier, before saving or paying the bill.

Step by step

1. Add items to the bill on the counter.
2. Tap **Takeaway** (below the bill). The button shows pressed. The hint reads: **Mark this bill as a takeaway order. It prints with the takeaway tag and goes to the kitchen on settle.**

3. Charge as usual (Part 3). The receipt shows a **Takeaway** line under the store name.

4. Every new bill starts with Takeaway off.

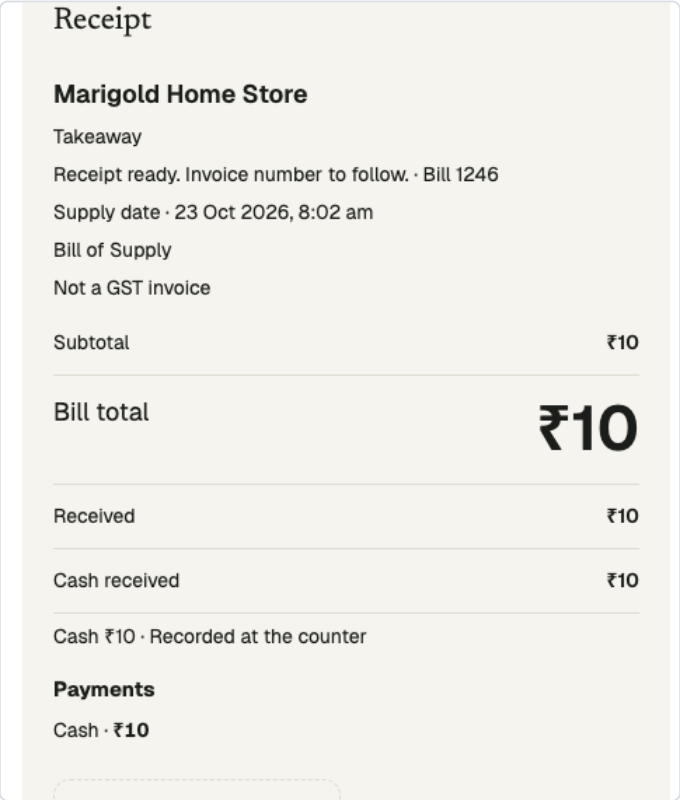

The counter with Takeaway switched on and its hint line visible.

Edge cases

- Takeaway is fixed once the bill is saved: the screen says **Takeaway is fixed once the bill is saved.** To change it, the bill must be recreated. The server only accepts the takeaway mode when the bill is created.
- While a payment is being taken the switch is locked.
- A held bill keeps its Takeaway setting when resumed.

- The Takeaway line appears on the screen receipt and on the printed bill. The printed line is in English.

The receipt preview of a takeaway bill, showing the Takeaway line under the store name.

Test checklist

#	What you do	What you should see	If you see something else
1	Start a new bill.	**Takeaway** is off.	On by default: log it.
2	Tap **Takeaway**.	Pressed state plus the hint sentence.	No hint: log it.
3	Charge and pay cash.	The **Paid** receipt has a **Takeaway** line.	Line missing: log the bill number.
4	Hold a takeaway bill and resume it.	Takeaway is still on, and cannot be changed.	Switched off: log it.

4.5 Kitchen tickets: confirm, failure, and the Orders rail

What it's for: making sure the kitchen really has an order before the guest is billed, and handling a ticket that did not arrive.

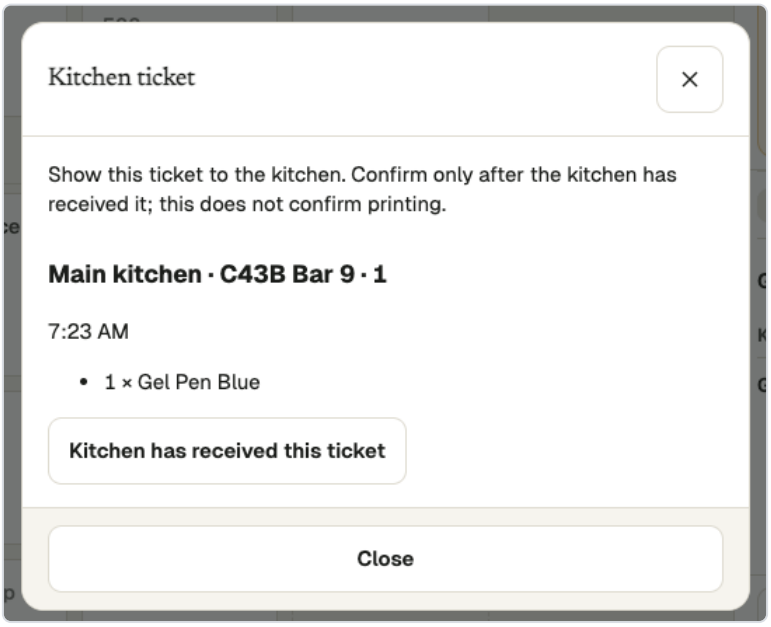

Who uses it: the cashier and the kitchen.

```
Send KOT
   |
ticket delivered? --yes--> Sent to kitchen -> Settle allowed
   |
   no
   v
Kitchen delivery failed / Queued
   |
+-------------------------+-------------------------+
| Dine-in (or a bill that | Takeaway bill           |
| already has a ticket)   |                         |
| Payment REFUSED         | Payment goes through    |
| Confirm kitchen receipt | Orders rail: kitchen    |
| then pay again          | issue shown; Ready for  |
|                         | pickup / Handed over are|
|                         | blocked until resolved  |
+-------------------------+-------------------------+
```

Dine-in or a bill with an unresolved ticket

1. You tap **Settle**. The payment is refused with: **The kitchen has not confirmed this order yet. Confirm the kitchen receipt, then take payment again.**
2. A **Confirm kitchen receipt** button appears. Tap it. The **Kitchen ticket** dialog opens: **Show this ticket to the kitchen. Confirm only after the kitchen has received it; this does not confirm printing.**
3. When the kitchen has the ticket, tap **Kitchen has received this ticket**.
4. **Settle** is enabled. Take payment again.

On a table order the failure shows as a card: **Main kitchen · Kitchen delivery failed**, with **Confirm kitchen receipt** and **Check kitchen receipt**, and the advice **Confirm once the kitchen has the ticket, and do not send another ticket meanwhile.** Do not press **Send KOT** again, that risks a double order.

The Kitchen ticket dialog asking the cashier to confirm the kitchen has received the ticket.

Takeaway bill whose kitchen ticket failed

A takeaway payment does not wait for the kitchen. The payment settles first and there is no error banner. The problem then lives on the **Orders** rail: while the kitchen delivery is unresolved, **Ready for pickup** and **Handed over** are blocked with **Resolve the kitchen work before marking this order ready.** The rail also reads **Kitchen ticket is queued or failed. Resolve it before continuing.**

This is the shipped behaviour as walked on the local stack. Whether takeaway payment should instead be refused like dine-in is an open question for the owner.

Test checklist

#	What you do	What you should see	If you see something else
1	Settle a dine-in bill whose ticket is unresolved.	The refusal sentence and the **Confirm kitchen receipt** button.	Payment accepted: log it. This is a defect for dine-in.
2	Tap **Confirm kitchen receipt**, then **Kitchen has received this ticket**.	The dialog closes and **Settle** works.	Still refused: log it.
3	Pay a takeaway bill whose ticket failed.	Payment succeeds, no banner.	Payment refused: record it, it is an open question (W1).
4	Open that order on the **Orders** rail, try **Ready for pickup**.	Blocked with **Resolve the kitchen work before marking this order ready.**	Allowed: log it.
5	Resolve the kitchen delivery, try again.	**Ready for pickup** works.	Still blocked: log it.

4.6 Closed counter notice

If the register is closed, restaurant screens show **Counter closed**, **Your next sale starts a new register session.** and **View day summary**. Starting a sale opens a new session. See Part 5 and the register report.

4.7 QR table orders (owner side)

What it's for: letting guests send an order from their own phone by scanning the QR code on the table. Staff stay in control of what goes to the kitchen.

Who uses it: the owner sets it up; floor staff seat tables and handle requests.

```
Owner: Settings > POS > Table ordering
      |
turn on Accept guest orders by QR
      |
create / print a QR per table
      |
Guest scans -> six-digit seating code -> sends order
      |
 Staff check first?  --yes--> Guest requests: Waiting for staff
      |                           staff approve -> kitchen
      no
      v
 Send to kitchen automatically
      |
 Guest: Ask for bill -> pays at the counter (Part 3)
```

Owner setup

1. Open **Settings** > **POS** > **Table ordering** (`/settings/pos/table-ordering`).
2. Turn on **Accept guest orders by QR**. **Pause new guest requests** stops new requests without losing the setup.
3. **Dine-in menu works when the online shop is closed** lets guests order even if the online shop is closed.
4. Choose how guest orders are handled: **Staff check first** (every request waits for staff) or **Send to kitchen automatically**.
5. Tap **Save settings**.
6. For each table, **Create QR** (or **Replace QR**, which asks for a **Reason**), then download the label and stick it on the table.

Seating a table

1. Open **Seating** (`/settings/pos/table-ordering/seating`).
2. **Choose a table**, enter **Number of guests**, and tap **Seat table and get join code**. A six-digit code is shown for the table.
3. Guests scan the QR and enter the **Seating code**. **Change join code** issues a new one; **Remove guest** removes a guest who should not be on the table.
4. When the guests ask for the bill, staff use **Release bill for payment**. The bill is paid at the counter as in Part 3. **Close table** ends the seating.

Guest requests

Guest requests (`/settings/pos/table-ordering/requests`) is a read-only list: **Waiting for staff** and **Already handled**. With **Staff check first**, staff review a request on the table order and send it to the kitchen.

Guest side in short

The guest scans the QR, enters the six-digit seating code, picks items and taps **Send order to staff** (or **Send to kitchen** when the store sends automatically), and later **Ask for bill**. The guest never pays on the phone; payment is at the counter.

Test checklist

#	What you do	What you should see	If you see something else
1	Open the Table ordering settings.	**Accept guest orders by QR** with **Save settings**.	Page missing: the add-on or role may not allow it.
2	Create a QR for a table.	A QR with a download label.	No QR: log it.
3	Seat a table with 2 guests.	A six-digit join code.	No code: log it.
4	Scan, enter the code, send an order (staff-check mode).	The request shows under **Waiting for staff**.	Straight to the kitchen in staff-check mode: log it.
5	Turn on **Pause new guest requests**.	New requests are refused with a pause message.	Orders still accepted: log it.

Not yet verified in the local walk: the owner QR pages were not walked (blocked); the descriptions above come from the audited public docs, not a recorded run.

4.8 Troubleshooting

Question	Likely cause and what to do
Why is there no **Tables** button?	The restaurant add-on is off, or the counter is not the menu-tile layout.
Why can’t I settle the table?	An item is unsent, or the kitchen ticket is unresolved. Read the footer line.
Why was payment refused with “The kitchen has not confirmed”?	The ticket was queued or failed. Use **Confirm kitchen receipt** once the kitchen has it.
Why can’t I mark a takeaway order ready?	The kitchen delivery for that order is unresolved. Resolve it first.
Why can’t I change Takeaway on a saved bill?	It is fixed once the bill is saved.
Why don’t guests see the ordering page?	**Accept guest orders by QR** is off, **Pause new guest requests** is on, or the table is not seated with a code.

4.9 Open questions for the owner

#	Question	Today's behaviour
W1	Should takeaway payment be refused when the kitchen ticket failed?	Payment goes through; the issue is held on the Orders rail.
W2	Should **Takeaway** be hidden on retail counters?	Shown on any counter of a restaurant-active store.
W3	Should dine-in payment stay blocked on an unresolved ticket?	Yes, blocked until **Confirm kitchen receipt**.

Part 5 — After the sale

This part covers everything that happens to a bill once it is paid: printing and reprinting the receipt, voiding a paid bill, returns and refunds, and appointments that are billed or cancelled at the counter. It ends with the whole life of a bill in one picture.

5.1 Receipt preview, print and reprint

What it's for: giving the customer a bill, and printing it again later without confusing it with the original.

Who uses it: cashiers.

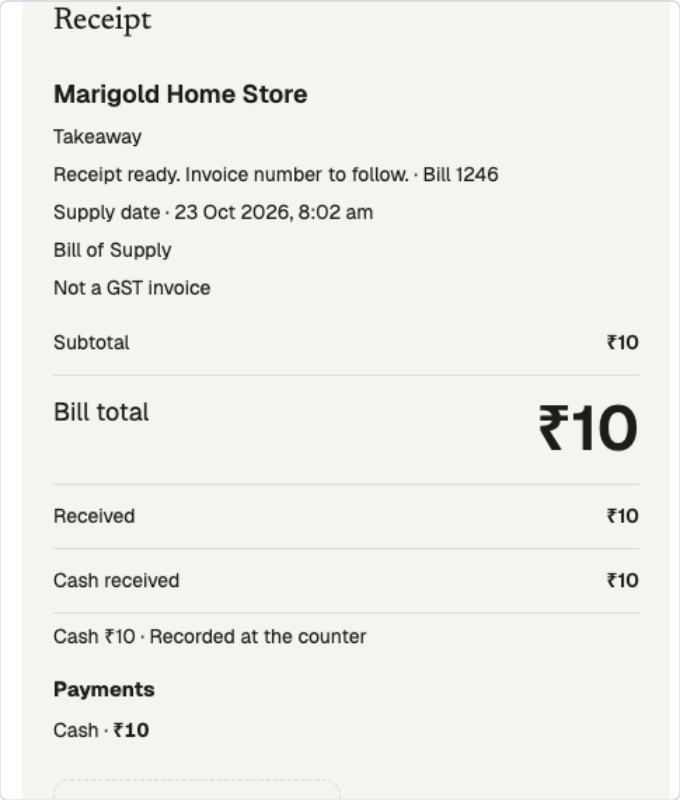

Step by step

1. After payment the **Paid** screen shows the **Receipt** panel on the right. Check the store name, bill number, items, totals and the **Payments** list.
2. On a takeaway bill the **Takeaway** line shows under the store name.
3. **Complete sale and print bill** prints and starts the next bill. **Complete without receipt** skips printing. **Send bill on WhatsApp** and **Share** send it digitally. **View receipt** opens the full receipt.
4. **Print options** lets you pick the paper (58 mm or 80 mm), the receipt language, and **Document copy**.
5. To reprint an old bill later, open **Orders** > **Today**, select the bill and use **View receipt** or **Print options**.

Rules to know

- A reprint of a bill that was already printed is forced to read **Duplicate of original document**. It cannot be passed off as the original.
- A bill that is not a GST invoice reads **Bill of Supply** and **Not a GST invoice**.
- Right after payment the panel may say **Receipt ready. Invoice number to follow.** until the final invoice number arrives.
- A voided bill has no receipt: **This bill was voided. There is no receipt to print.**

- The printed Takeaway line is in English, whatever the receipt language.

The receipt preview for a takeaway bill.

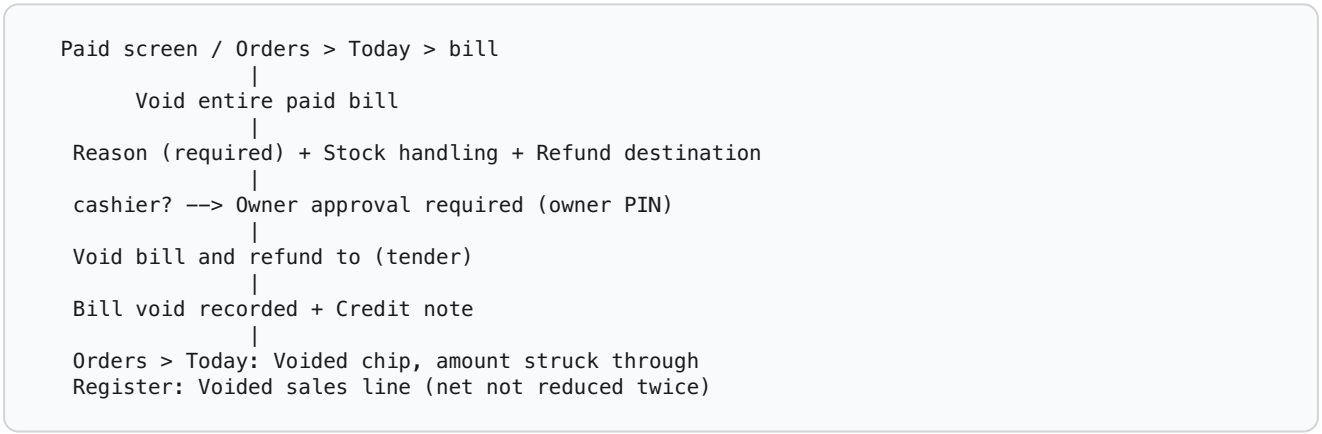

Test checklist

#	What you do	What you should see	If you see something else
1	Open a paid takeaway bill, view the receipt.	A **Takeaway** line under the store name.	Missing: log the bill number.
2	**Print options**, choose 58 mm, then 80 mm.	The preview width changes.	No change: log it.
3	Print the same bill a second time.	The copy reads **Duplicate of original document**.	A second “original”: log it.
4	Open a voided bill’s receipt.	**This bill was voided. There is no receipt to print.**	A receipt prints: log it.

5.2 Void a paid bill

What it’s for: cancelling a whole paid sale (wrong sale, test sale, customer cancelled) and refunding it in one step. After the first few seconds the Paid screen’s **Undo** is gone, and this is the next tool.

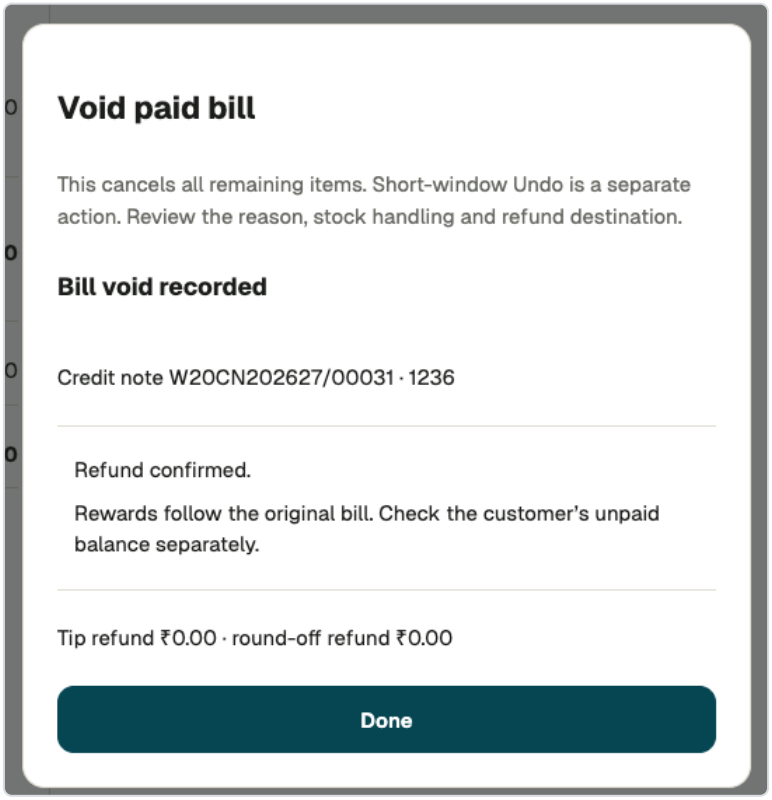

Who uses it: the owner, or a cashier with the owner’s approval.

Step by step

1. Open the paid bill (the **Paid** screen, or **Orders** > **Today** > the bill) and tap **Void entire paid bill**.
2. The **Void paid bill** dialog says: **This cancels all remaining items. Short-window Undo is a separate action. Review the reason, stock handling and refund destination.**
3. Choose the **Reason** (required).
4. Choose **Stock handling**: **Back to shelf** puts the items back into stock; **Damaged** writes them off.
5. Choose **Refund destination** (for example Cash).
6. For a cashier, an **Owner approval required** panel asks for the owner PIN. The owner's PIN is typed by the owner, never shared.
7. Tap **Void bill and refund to** the chosen method (on a phone: **Void and refund**).

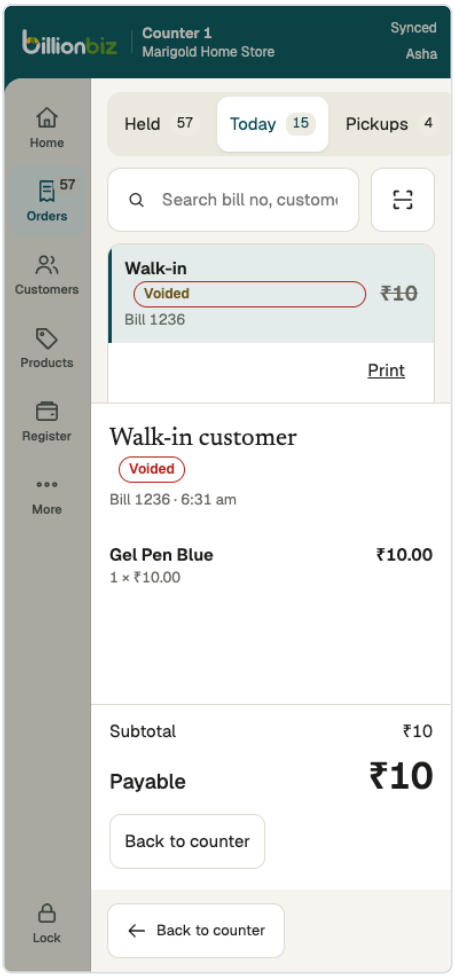

8. The result shows **Bill void recorded**, the credit note number, **Refund confirmed.** and **Done**.

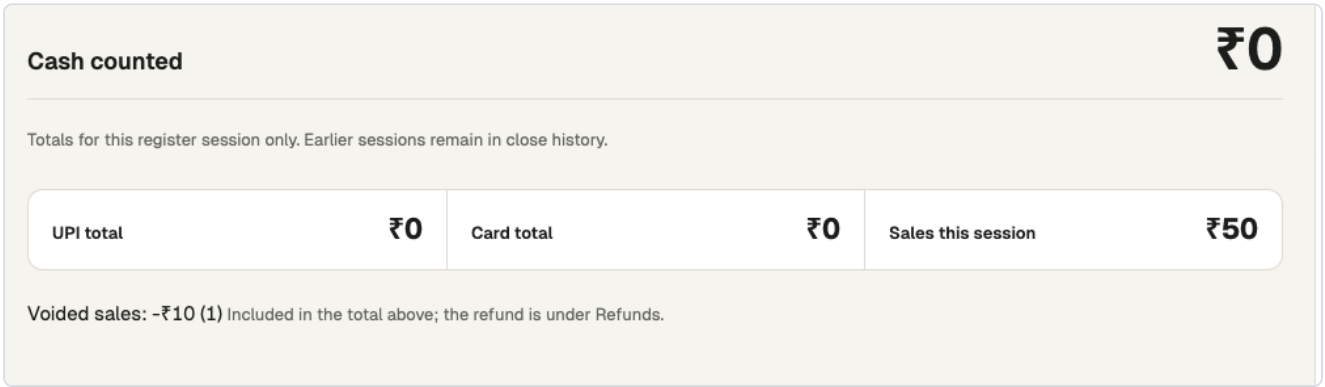

The result of a void: Bill void recorded with the credit note and refund confirmation.

What changes afterwards

Where	What you see
Orders > **Today**	The bill row shows a **Voided** chip and the amount is struck through.
The bill's Paid screen	**This bill was voided. There is no receipt to print.**
Register / day summary	A line **Voided sales** with the amount and count (for example -₹10 (1)), with the note that it is included in the total above and the refund is under **Refunds**. The net total is not reduced twice.
Drawer	**Expected in drawer** falls by the cash refunded, shown as a cash-out line **Cash refunded**.

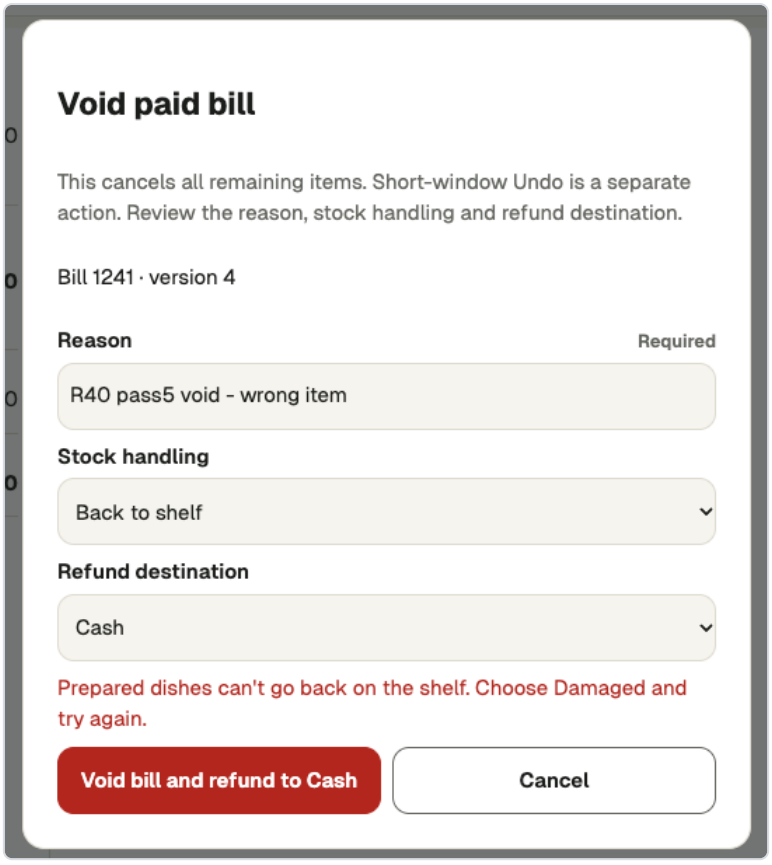

Orders > Today on a phone: the voided bill shows a Voided chip. On this width the chip is stretched across the row, a cosmetic issue noted for the design team.

The Count the drawer screen with the Voided sales line.

Edge cases and what is blocked

- **Prepared dishes cannot go back on the shelf.** Voiding a bill with cooked items and choosing **Back to shelf** is refused: **Prepared dishes can't go back on the shelf. Choose Damaged and try again.**

The void dialog refusing Back to shelf for a prepared dish.

- A bill where every item was already returned cannot be voided: **Every item on this bill has already been returned, so there is nothing left to void.**
- A voided bill cannot be returned: **A voided bill cannot be returned. Check Orders > Today.**
- If the drawer is waiting for a handover count, the void is blocked: **Count the cash and take over the drawer first, then void this bill.**
- A void cannot be undone. Make a new sale instead.

Test checklist

#	What you do	What you should see	If you see something else
1	Pay a cash sale, wait out the **Undo** countdown, tap **Void entire paid bill**.	The **Void paid bill** dialog with Reason, Stock handling, Refund destination.	No void button: check the role and the bill state.
2	Submit with no reason.	Refused, reason required.	Voided without a reason: log it.

#	What you do	What you should see	If you see something else
3	As a cashier, confirm.	**Owner approval required**.	Voided with no approval: log it.
4	Void a normal retail bill with **Back to shelf**.	**Bill void recorded**, **Refund confirmed.** Stock goes up by the quantity.	Stock unchanged: log the item.
5	Void a bill with prepared dishes, **Back to shelf**.	The prepared dishes refusal.	Accepted: log it (cooked food restocked).
6	Same bill, choose **Damaged**.	Voided; stock not increased.	Refused: log it.
7	Open **Orders** > **Today**.	**Voided** chip, struck-through amount.	Plain row: log it.
8	Open the register summary.	**Voided sales** line; net total not double-reduced.	Net reduced twice: log both totals.
9	Try to void a fully returned bill.	The “nothing left to void” message.	Voided: log it.

5.3 Returns and refunds

What it’s for: taking back some or all of the items from a paid bill and giving money back, or exchanging for another item.

Who uses it: cashiers (within their refund limit) and the owner.

```
Return / refund (Paid screen) or Orders > Today > bill
       |
Find bill (if started from the menu)
       |
tick items and quantities
       |
Return reason (required)
       |
Stock: Back to shelf / Damaged
       |
Refund to: Same as paid / Cash / Reduce udhaar
       |
Getting the refund quote... -> over cashier limit? -> owner approval
       |
Finish -> refund recorded + credit note
```

Step by step

1. From the **Paid** screen tap **Return / refund**, or use the returns entry in the menu and **Find bill** by number.
2. Tick the items to return and set the quantity. Only the quantity actually sold and not yet returned can be returned.
3. Choose **Return reason** (required): **Customer changed mind**, **Item damaged**, or **Wrong item**.

4. Choose where the item goes: **Back to shelf** or **Damaged**. Prepared (cooked) dishes follow the same rule as a void: they cannot go **Back to shelf**.
5. Choose **Refund to**: **Same as paid** (the original tender), **Cash**, or **Reduce udhaar** for a bill paid on credit. When the original method cannot be refunded directly the screen offers **Cash fallback**.
6. Wait for **Getting the refund quote...**. The amount comes from what the customer actually paid (after discount and tax).
7. A refund above the cashier's limit asks for the owner's approval.
8. Finish. The refund is recorded with a credit note and appears under **Refunds** in the day summary.

Exchange

1. Start the return as above, then **Choose replacement item**.
2. The screen shows what to give back or collect. **Finish exchange** completes it. **Give back** shows the amount returned to the customer.

Edge cases

- Returns after a void are blocked (see 5.2).
- A bill already fully returned cannot be returned again or voided.
- A return from an older shift is refunded from the current drawer. The register shows it as a refund in the current session.

Test checklist

#	What you do	What you should see	If you see something else
1	Open a paid bill, **Return / refund**, return one of two items.	A quote for only that item.	Quote for the whole bill: log it.
2	Try to finish without a **Return reason**.	Blocked.	Finished: log it.
3	Choose **Back to shelf** for a normal item.	Stock goes up.	Stock unchanged: log it.
4	Choose **Refund to Cash**.	Cash refund in the register.	Different tender: log it.
5	Return above the cashier limit.	Owner approval requested.	Refund went through: log it with the cashier and amount.
6	Return the second item.	The bill becomes fully returned and **Void** is refused.	Void accepted on a fully returned bill: log it.

5.4 Appointments at the counter

What it's for: billing and managing salon-style appointments from the POS counter, including deposits, cancels, no-shows and walk-ins.

Who uses it: cashiers (counter) and owners (rules).

Opening today's list

On the POS, open **More** > **Today's appointments**. Each appointment shows a status: **Booked**, **Arrived**, **In service**, **Finished**, **Cancelled**, **Did not attend**, or **Awaiting payment**. Select one for **Appointment details**, which includes the **Booking payment record**: **Required deposit**, **Payments captured**, **Refunds recorded** and **Net captured**.

Actions: **Reschedule**, **Cancel appointment**, **Did not attend**. When finished, the appointment is billed like any other sale (Part 3), with any captured deposit already counted as paid.

Deposits

- The deposit is a percentage. In Appointments settings, **Default deposit (%)** is the percent of the service price taken as a deposit (0 to 100). **No-show fee (%)** is the share kept for a no-show.
- A deposit already captured shows in the **Booking payment record** and reduces what is left to pay at the counter.

Cancel at the counter

1. Open the appointment and tap **Cancel appointment**.
2. The dialog tells you the deposit outcome using the store's **Cancellation window (hrs)**:
    - Cancelled within the window: **Cancelled within N h of the slot: the deposit of the amount is kept.** (or **no deposit is kept** when none was taken).
    - Cancelled earlier: **Cancelled more than N h before the slot: the deposit of the amount is refunded.** (or **any deposit is refunded**).
3. Confirm.

No-show (Did not attend)

1. Open the appointment and tap **Did not attend**. The dialog reads **Mark as not attended. The current deposit rule applies; no refund is promised.**

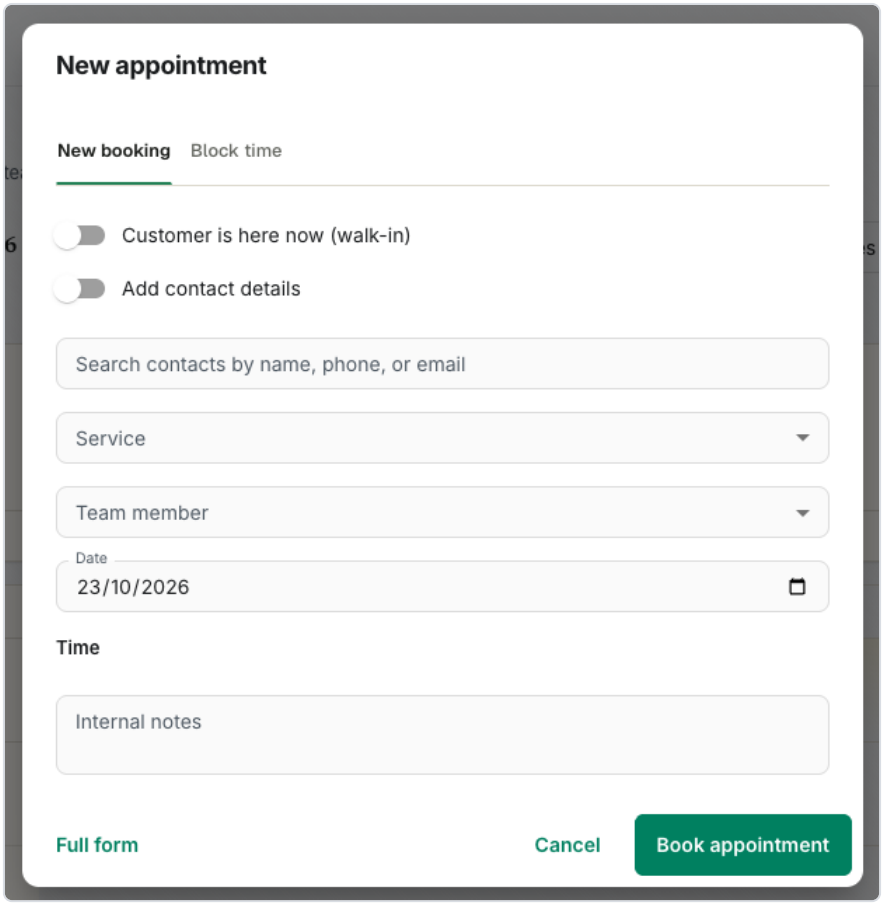

2. The owner's **No-show deposits** setting decides what happens to the deposit: **Keep the deposit** or **Refund the deposit**. It is set in POS settings under the **No-show deposits** tab and saved with **Save no-show policy**.
3. This setting applies to no-shows only. Counter cancellations always follow the cancellation window above.

Walk-in appointments

When a customer walks in and you create an appointment for them (admin **Appointments** > **Calendar** > **New booking**, or the **In person** preset), the **New appointment** dialog has two independent switches, both off by default:

Switch	What it does
Customer is here now (walk-in)	Marks the appointment as a walk-in. It changes the source only.
Add contact details	Lets you enter a new contact or pick an existing customer. Leave it off to book without contact details.

The two switches do not affect each other. A walk-in can have no contact details; a phone booking can have them.

The New appointment dialog with the two switches Customer is here now (walk-in) and Add contact details.

On the counter itself, `/walk-in` offers **New walk-in** with **Start and bill**.

Edge cases

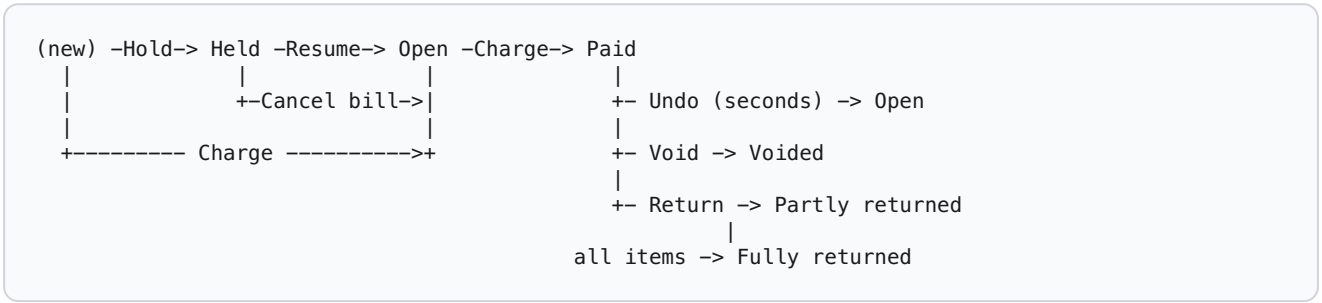

- The full-page `/appointments/new` form uses different wording: the switch there is **Use an existing contact** and it is on by default. The two screens differ and this is logged as an open question.
- A deposit refund on a no-show applies only when the owner chose **Refund the deposit**.

Test checklist

#	What you do	What you should see	If you see something else
1	Open **More** > **Today's appointments**.	The list with status chips.	Empty with bookings today: check the date and store.
2	Open an appointment with a deposit.	**Booking payment record** shows the deposit.	Missing deposit: log it.
3	Cancel inside the window.	The "deposit is kept" sentence.	"Refunded" inside the window: log it.

#	What you do	What you should see	If you see something else
4	Cancel outside the window.	The “deposit is refunded” sentence.	“Kept”: log it.
5	Set No-show to **Keep the deposit**, mark **Did not attend**.	Deposit kept.	Refunded: log it.
6	Set **Refund the deposit**, mark a second **Did not attend**.	Deposit refunded and shown under **Refunds**.	Not refunded: log it.
7	**New booking**, switch on only **Customer is here now (walk-in)**.	Booking saved as walk-in without contact details.	Contact required: log it.
8	Switch on only **Add contact details**.	Contact fields appear; source is not walk-in.	Source changes to walk-in: log it.

5.5 The life of a bill

Status	Where you see it	What you can still do
Open	The counter, or a table on the Tables floor	Add items, discount, hold, charge.
Held	**Orders** > **Held**	**Resume bill**, **Resume to charge**, **Cancel bill**.
Paid	**Paid** screen, **Orders** > **Today**	Print or reprint, **Return / refund**, **Void entire paid bill**, **Undo** for a few seconds.
Voided	**Voided** chip in **Orders** > **Today**	View only. No receipt, no return.
Partly returned	The bill’s return history	More returns of the remaining items.
Fully returned	The bill’s return history	Nothing. Void is refused.

5.6 Troubleshooting

Question	Likely cause and what to do
Why can’t I find **Void entire paid bill**?	The bill is already voided, or your role cannot void. Ask the owner.
Why is the void refused for a prepared dish?	Cooked food cannot go back on the shelf. Choose **Damaged**.
Why is the register total unchanged after a void?	The **Voided sales** line is shown for information and is already included in the total; the refund appears under **Refunds**.
Why does the deposit stay with the shop after a cancel?	The cancel was inside the **Cancellation window (hrs)**.
Why wasn’t my no-show deposit refunded?	The owner’s No-show setting is **Keep the deposit**.
Why does a walk-in ask for contact details?	**Add contact details** is switched on, or you are on the full-page form where the existing-contact switch is on by default.

Part 6 — Offline Mode (Cash Only)

This part explains what the counter does when the internet is lost, how to get a counter ready for it, how to sell for cash while offline, and what happens when the connection comes back. Offline mode is **cash only**. UPI, Manual UPI, Card and Split are refused while the counter is offline, so no payment is ever queued that the server has not seen.

6.1 Before you start: the three things offline needs

Offline selling is not automatic. A counter can only sell offline if the owner prepared it **while online**, in the same browser the cashier uses.

Need	Plain meaning
A bound, approved counter device	The browser has been approved as a counter (see Counter devices in the earlier parts). An unapproved or unbound browser cannot prepare.
The store owner prepares it	Only the store owner signs in to the preparation page. A cashier PIN cannot do it.
POS enabled and offline preparation switched on	The POS add-on must be active for the store, and offline preparation must be available for it.

Two limits to know up front:

- **The offline lease.** A prepared counter may sell offline up to **300 bills or ₹2 lakh in total**, whichever comes first. Sending the waiting bills to the server does not reset this count. The counter must reconnect and be prepared again to renew it.
- **Stores that track stock per location** cannot prepare an offline copy. They see a refusal on the preparation page and cannot sell offline.

If a counter has not been prepared, the Charge button stays disabled when the connection drops, and the counter shows **You are offline. Reconnect before saving or taking payment. This draft is only in this tab and will be lost if you reload.**

6.2 Prepare a counter for offline use (owner)

What it's for

Saves a checked copy of the product catalog on the counter's browser and grants offline access, so the counter can keep billing in cash when the internet is down.

Who uses it

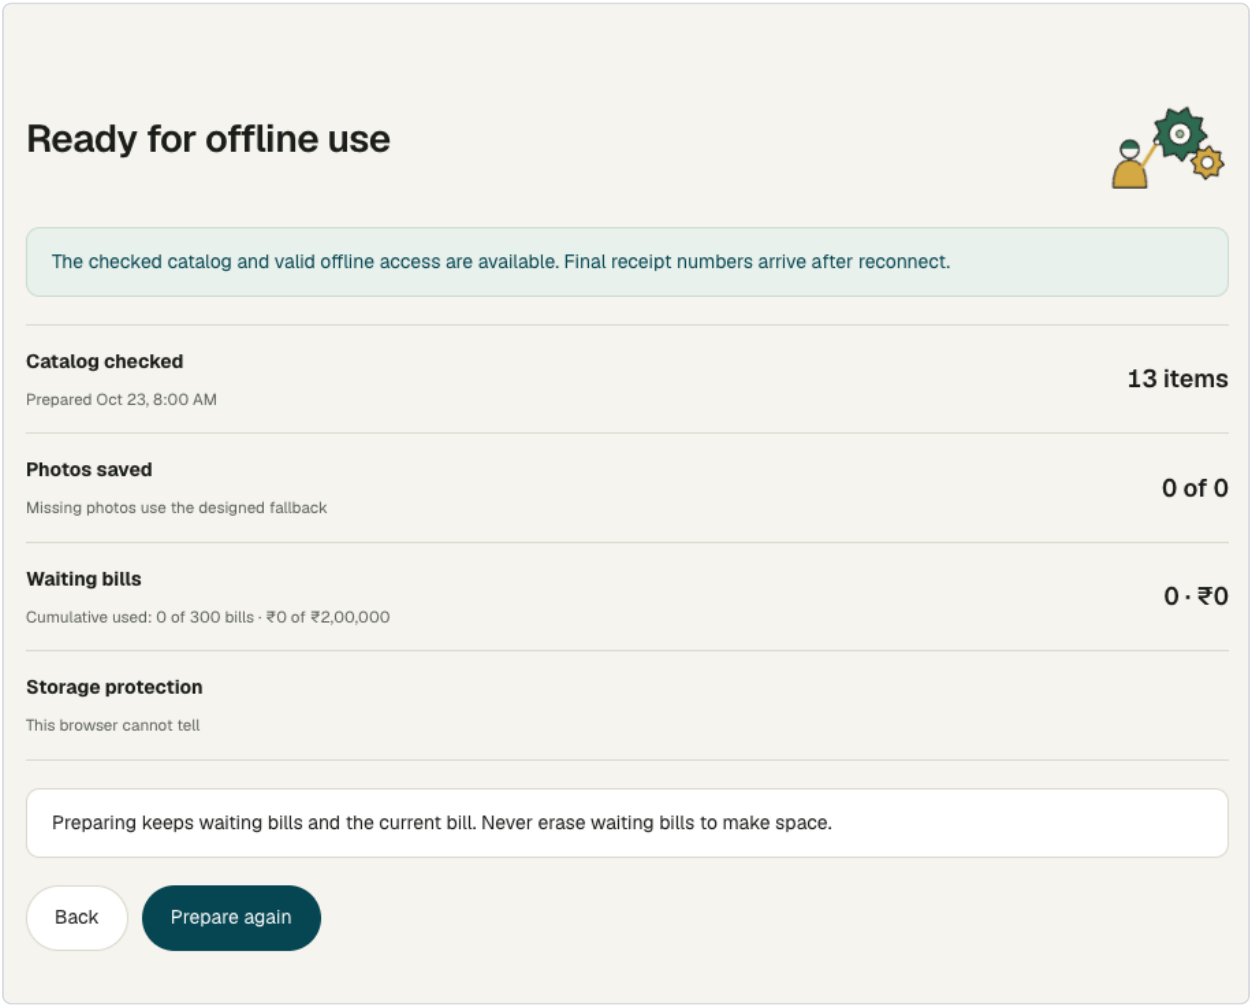

The store owner, on the counter device, while online.

Step by step

Nav path: **Counter devices → Settings → Prepare for offline** (the page opens at `/settings/pos/offline` in the Admin Panel).

1. Sign in as the store owner on the counter's browser and open **Prepare for offline**.
2. Select **Prepare offline copy**. The page moves through **Preparing catalog** and **Checking saved catalog**.
3. When the new copy is checked, the page offers **Use this copy** and **Keep current copy**. Select **Use this copy** to activate the new copy on this device.
4. The page then reads **Ready for offline use**. It lists how many catalog items were checked, how many photos were saved, the **Waiting bills** count and amount, the cumulative offline use (for example **0 of 300 bills · ₹0 of ₹2,00,000**), and a **Protect storage** control.

5. To refresh the copy later (new products, renewed lease), select **Prepare again** while online and choose **Use this copy** again.

Prepare for offline page showing Ready for offline use, catalog checked, waiting bills and cumulative limit

What happens behind the scenes

The counter downloads the catalog, checks it, and stores it in the browser together with a time-limited access lease. The lease is what lets the counter keep selling when the server cannot be reached. Bills sold offline are saved in an encrypted local queue on this device.

Statuses you will see on the page

Status or action	Meaning
Prepare offline copy / Prepare again	Starts a fresh download and check. Needs internet.
Preparing catalog, Checking saved catalog	Work in progress. Wait.

Status or action	Meaning
Use this copy	The new copy passed its check. Select it to activate.
Keep current copy	Leave the older copy active.
Ready for offline use	The device can sell offline now.
Owner review needed	Some saved bills were held back and need the owner (see section 6.6).
Review held bills, Recovery details	Where the owner looks at held bills.

Edge cases and what is blocked

- **Per-location-stock store:** preparation is refused. Offline selling is not available for that store.
- **Cap reached:** at 300 bills or ₹2 lakh the counter shows an **Offline limit reached** notice and refuses further offline sales until it reconnects and is prepared again.
- **Lease ended:** the counter shows **Offline access has ended.** and cannot sell offline until the owner prepares again online.
- **Prepare again did not replace the copy:** you must select **Use this copy**. Preparing alone does not switch the active copy.

6.3 The counter goes offline

What it’s for

Shows how the counter notices it has lost its connection and tells the cashier.

Who uses it

Every cashier. Nothing needs to be pressed; the counter detects it on its own.

The two ways a counter goes offline

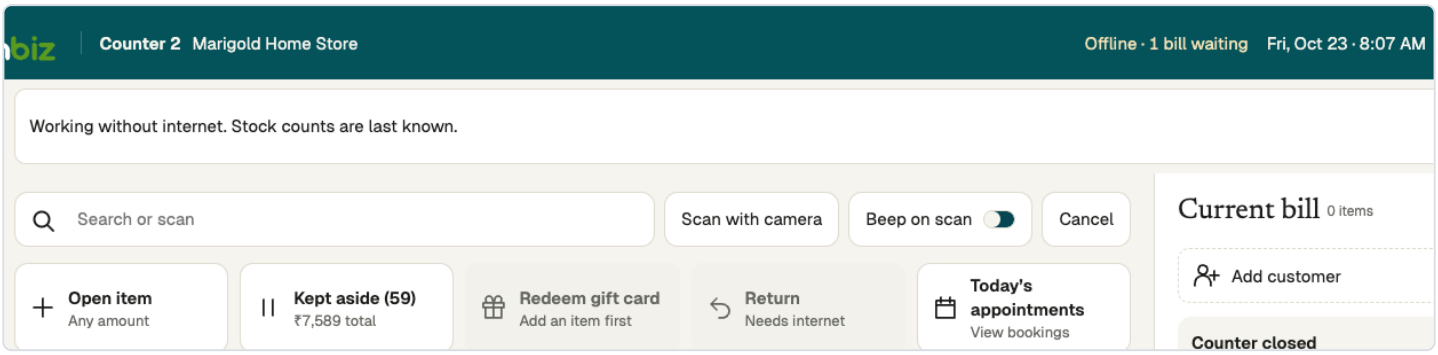

Mode	What is wrong	How the counter reacts
Network down	The device has no internet at all (Wi-Fi off, cable out).	The header changes to Offline straight away.
API down, network up	The device has internet but the BillionBiz server cannot be reached.	The counter checks the server health. After two failed checks in a row, or one failed check confirmed by an immediate health probe, it switches to Offline. Checks run at least 10 seconds apart, so allow a few seconds up to about half a minute.

Both modes behave the same for the cashier: the same header, the same strip, the same cash-only rule, and the same refusal message.

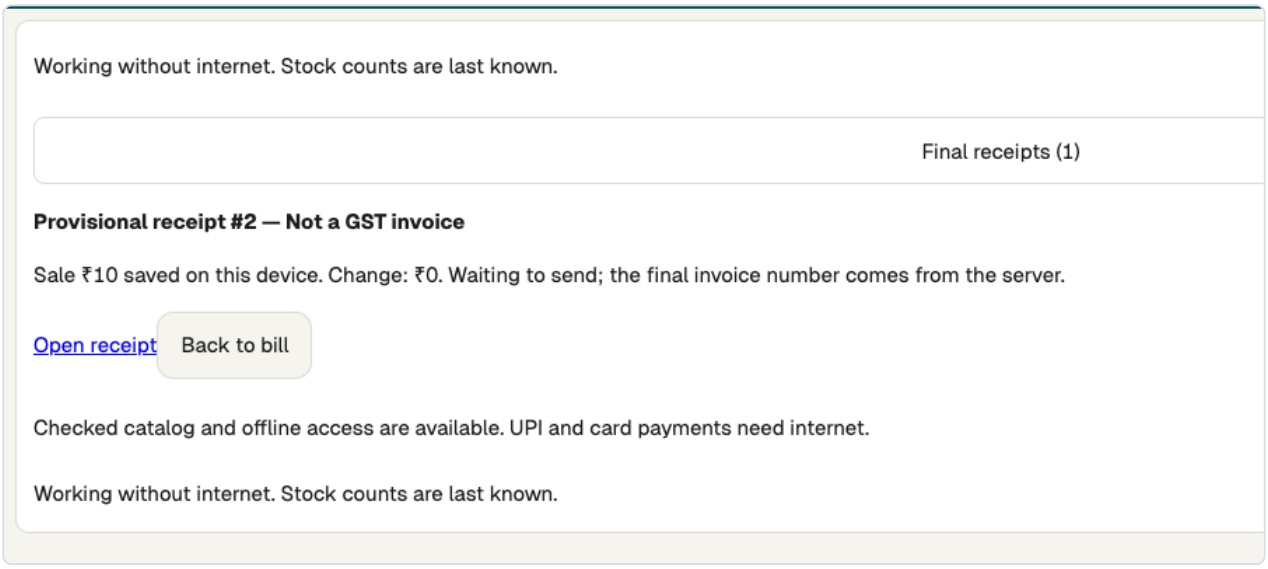

What you will see

- **The header** (top right of the counter) changes from ✓ **Synced (time)** to **Offline · 0 bills waiting**. After the first offline sale it reads **Offline · 1 bill waiting**, then **Offline · N bills waiting**.
- **On a phone** (700 px or narrower) the header shows the short form: the cloud-with-a-slash icon, **Offline**, and a number pill.
- **The offline strip** appears above the product grid. It reads **Working without internet. Stock counts are last known.** and has a **Details** button.
- **Details** unfolds a panel with the readiness line **Checked catalog and offline access are available. UPI and card payments need internet.** plus the provisional receipt line and the Undo option when they apply.

- Tiles that need the server are disabled. For example, **Return** shows **Needs internet**.

Counter home while offline: header Offline, strip Working without internet, Return tile Needs internet

Offline strip opened with Details: readiness copy, final receipts, provisional receipt

Header states at a glance

Header text	Meaning	Cashier action
✓ Synced (time)	Online, nothing waiting.	None.
Connecting…	Counter data not loaded yet.	Wait a few seconds.
Offline · N bills waiting	No connection. N bills are saved on this device.	Keep selling cash if ready. Do not clear browser data.
Syncing · N bills waiting	Connection is back, bills are being sent.	Leave the counter open.
Needs attention · N bills waiting (red)	A saved bill needs owner review, or offline storage is unavailable.	Tell the owner (section 6.6).

6.4 Sell for cash while offline

What it’s for

Keeps the shop selling during an outage without losing a sale.

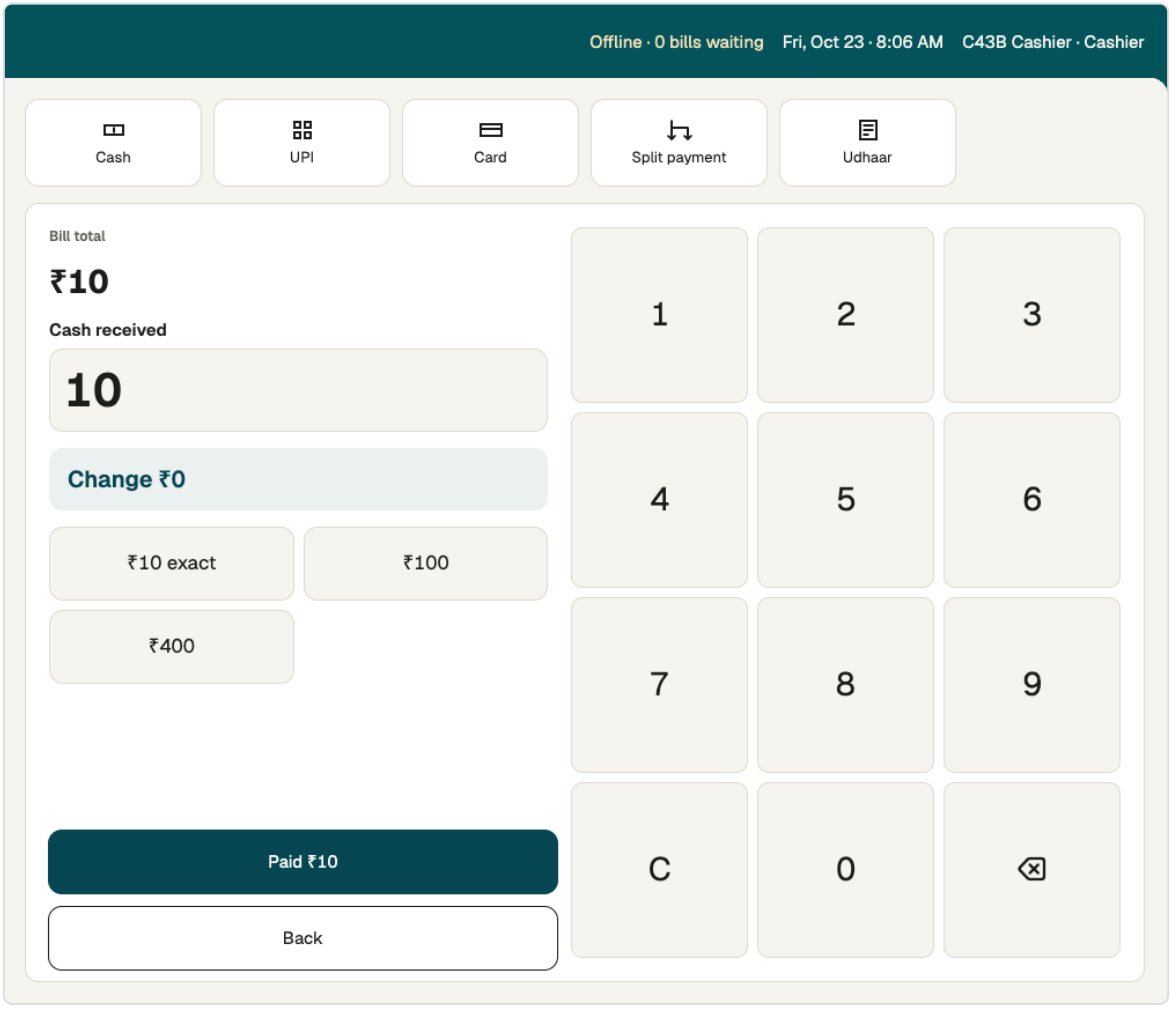

Who uses it

Cashiers with a current, unlocked cashier session. **Order takers cannot take payment.**

Step by step

1. Check the strip says **Working without internet**. Open **Details** if you want to confirm the readiness line.
2. Add items from the catalog on the counter home. Use items that are in the saved catalog, with whole positive quantities. Weighed and length-based items also work on a prepared counter.
3. Select **Charge**.
4. Select **Cash**. The cash keypad opens with the bill total, **Cash received**, and **Change**. Quick amounts such as the exact total appear under the field.
5. Enter the cash received and select **Paid**.
6. The bill is saved on this device. The counter returns to an empty home screen. The only confirmations are the header count (for example **Offline · 1 bill waiting**) and, in **Details**, the line **Provisional receipt #N — Not a GST invoice**.

7. Write **#N** on the customer's copy. It is the bill's short number on this device. The final invoice number comes from the server after reconnecting.

Charge screen while offline: header Offline, Cash keypad with bill total and Paid button

What happens behind the scenes

The sale, its prices, taxes and cash tender are encrypted and added to a queue in this browser. Each queued sale waits for the server. Nothing leaves the device until the connection returns.

What is blocked offline

Action	What happens
UPI, Manual UPI, Card, Split	Refused (section 6.5).
Return	The tile shows **Needs internet**.
A bill already started online	Cannot be sold offline (see below).

Action	What happens
Held bills, table bills, services, free-text lines, exchanges, loyalty	Do not use the offline sale path.
Close register, Print report	Need the server. See Part 7.
Offline limit reached or access ended	Refused with a notice until the owner prepares again online.

A bill started online, then the connection dropped. Once the server holds the bill, it cannot be re-sent as an offline sale. Charging it offline shows **This bill was started online, so it can only be paid when the connection is back. Wait for the internet, or start a new bill.** Either wait and charge the same bill, or ring the items up again as a new bill.

Takeaway. On a restaurant counter, a bill marked **Takeaway** can still be sold offline and is sent to the server as a takeaway order on reconnect.

6.5 UPI, Card and Split are refused offline

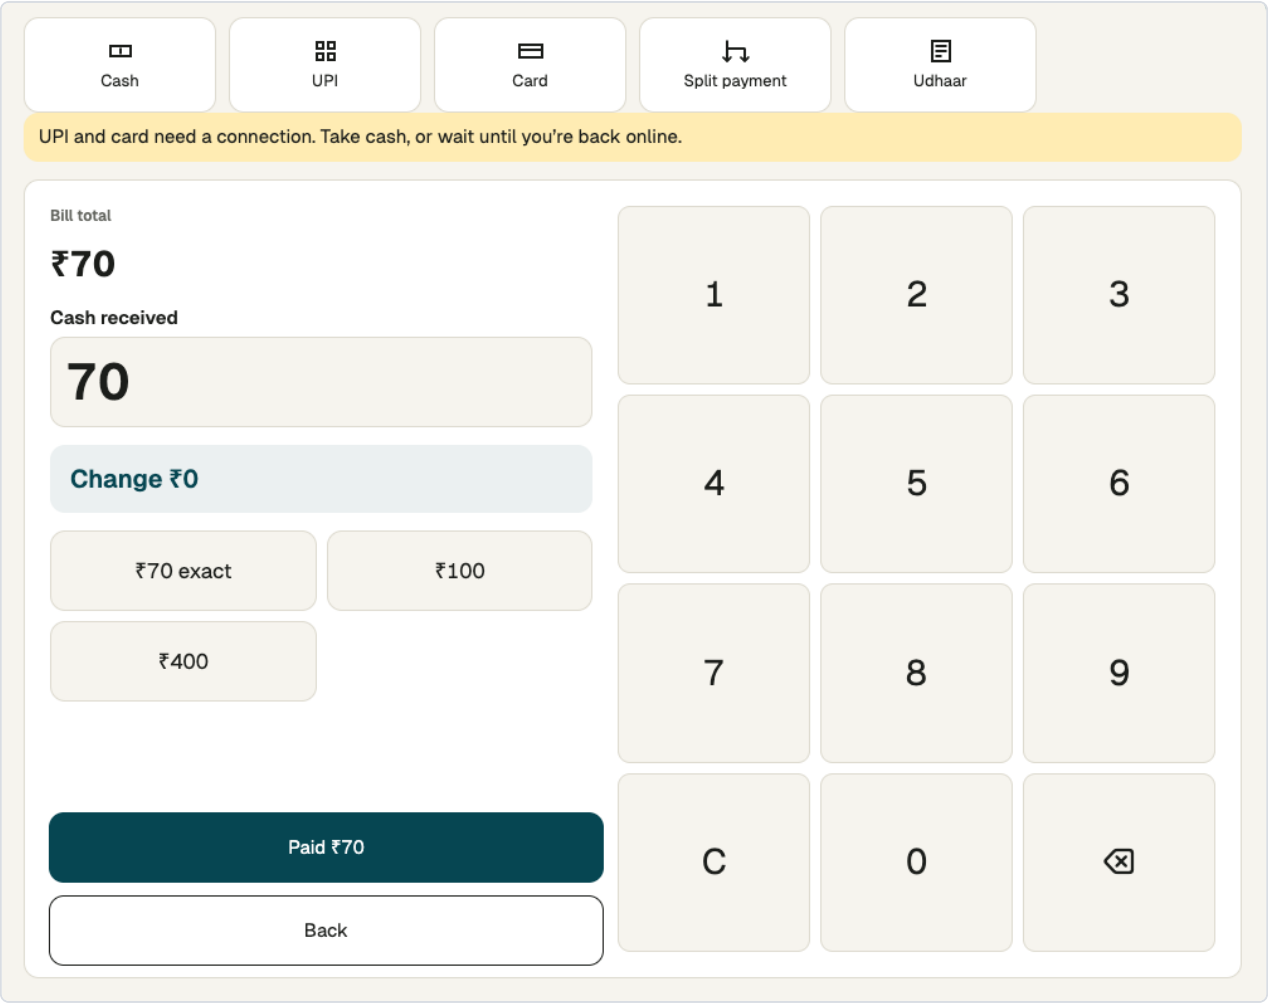

What it’s for

Stops a customer from paying by a method that cannot be confirmed without the server.

Step by step

1. Add items and select **Charge** while the counter is offline.
2. Select **UPI**, **Card** or **Split payment**.
3. No QR code and no payment sheet opens. The counter shows an amber bar that reads **UPI and card need a connection. Take cash, or wait until you’re back online.** The bar sits on the Charge screen itself, directly under the payment method buttons and above the cash keypad, so you can read it without leaving Charge. It stays until the connection returns.
4. Switch to **Cash** to finish the sale, or wait until the header says **Synced** and take the payment normally.

Manual UPI is not offered offline. Because UPI is refused before the payment sheet opens, the Manual UPI fallback cannot be reached. This is the current ruling (open question W6).

The offline Charge screen: the amber bar under the payment method buttons reads UPI and card need a connection. Take cash, or wait until you're back online.

What to check

- No payment request is sent to the server and no QR code appears.
- The refused tender leaves no queue entry. Only the completed cash sale adds to **bills waiting**.
- The message clears by itself when the connection returns, and UPI, card and split work again.

Udhaar offline

Udhaar (customer credit) is the one other tender that can work offline, only for repeat customers the owner approved with **Allow this repeat customer for offline credit**, within the saved credit limit, and after the owner renews offline access while connected.

6.6 Reconnect, sync and owner review

What it’s for

Gets every offline sale to the server exactly once and turns each provisional receipt into a final one.

Who uses it

Cashiers (just keep the counter open). Owners for any held bills.

Step by step

1. When the connection returns, the header changes to **Syncing · N bills waiting**. Leave the counter open and in the same browser.
2. The count drops as the server accepts each bill. When none remain, the header reads ✓ **Synced (time)**.
3. In **Details**, the **Provisional receipt #N** line is replaced by **Final receipt** with the invoice number and the original provisional number. The summary shows **Final receipts (N)**.
4. Do not enter the sale again. If a bill is accepted but its receipt is not ready yet, you see **1 bill sent, receipt pending.** That bill is not counted in the chip.

The Waiting bills chip

After a saved bill has waited about 30 seconds, a **Waiting bills: N** chip appears above the bill. Select it to list the waiting bills, each with **Saved — will send**. If a bill waits more than 15 minutes, the chip reads **N bills waiting over 15 minutes — check internet.** Check the shop Wi-Fi. The bills stay saved on the device until they are sent. Do not clear browser data.

Owner review of held bills

If a saved bill needs the owner’s attention before it can be sent, the counter holds it for review. The header turns red, **Needs attention · N bills waiting**, and a notice reads **These saved bills need owner review**.

The owner opens **Prepare for offline**, where **Waiting bills** shows the count and amount, then uses **Review held bills** and **Recovery details** to see each held bill and what to do. This review path was not walked in the R40 pass (see Part 8, section 8.2).

Undo unsent sale

For a short time after an offline sale, a cashier may see **Undo unsent sale** in **Details**. It works only for 30 seconds after the sale, only for the last waiting sale, and only for sales that contain no cash. Offline selling takes cash (and approved udhaar), and any sale with a cash part is not undoable, so a normal offline cash sale cannot be undone this way. Once the bill has synced, use the return flow when it applies. If Undo is used, the line **Undo requested — waiting to send. The sale remains saved until the server confirms.** means the reversal is pending, not complete.

(Internally the queue calls this a tombstone. The screen never uses that word.)

Flowchart

```
Owner (online): Counter devices > Settings > Prepare for offline
       |
       v
Prepare offline copy -> Use this copy -> "Ready for offline use"
       |
       v
Counter online, header "Synced"
       |
  connection lost  (network down  OR  server unreachable)
       |
       v
Header "Offline", strip "Working without internet"
       |
       +--> tap UPI / Card / Split --> refusal message, no sale
       |
       v
Add items -> Charge -> Cash -> Paid
       |
       v
Sale saved on device, "Provisional receipt #N"
Header "Offline - N bills waiting"
       |
  connection returns
       |
       v
Header "Syncing" -> bills sent automatically
       |
       +--> a bill needs review --> "Needs attention" -> owner reviews
       |
       v
Header "Synced", "Final receipt" replaces provisional
```

6.7 Test checklist — Offline (both modes)

Run each mode (O-rows 3 to 12) twice: once with the device network off, once with the network on but the server blocked. Fixtures: see Part 8, section 8.1.

#	What you do	What you should see	If you see something else
O1	As the store owner, open **Prepare for offline** online and run **Prepare offline copy**, then **Use this copy**.	**Ready for offline use**, catalog items checked, **Cumulative used: 0 of 300 bills · ₹0 of ₹2,00,000**.	If preparation is refused, the device is not bound or approved, offline preparation is off, or the store tracks stock per location.
O2	On a counter that was never prepared, cut the connection and try Charge.	Charge stays disabled with **You are offline. Reconnect before saving or taking payment.**	If it lets you sell, record it as a defect.
O3	On a prepared counter, turn the network off.	Header becomes **Offline · 0 bills waiting** within seconds. Strip reads **Working without internet. Stock counts are last known.**	If the header stays Synced after a minute, note how long it took.
O4	Select **Details** on the strip.	Readiness line **Checked catalog and offline access are available. UPI and card payments need internet.**	Missing line: the counter is not fully ready. Prepare again online.
O5	Tap the **Return** tile.	The tile shows **Needs internet** and cannot be used.	A return opening offline is a defect.
O6	Add an item, **Charge**, **UPI**.	**UPI and card need a connection. Take cash, or wait until you're back online.** No QR or sheet. The amber bar is readable on the Charge screen without selecting **Back**.	A QR code or payment sheet is a defect. A refusal you can read only after selecting **Back** is also a defect.
O7	Same bill, select **Card**.	Same refusal text. No payment sheet.	As O6.
O8	Same bill, select **Split payment**.	Same refusal text. No payment sheet.	As O6.
O9	Look for any **Manual UPI** option.	It cannot be reached. UPI is refused first.	A reachable Manual UPI offline is a defect (ruling W6).
O10	Select **Cash**, enter the exact total, **Paid**.	Counter returns to empty home. Header **Offline · 1 bill waiting**. **Details** shows **Provisional receipt #N — Not a GST invoice**.	If you see an error toast instead, note the text and retry once.
O11	Start a bill online, cut the connection, and try to pay it.	**This bill was started online, so it can only be paid when the connection is back.**	A silent sale is a defect.
O12	Restore the connection. Wait.	Header **Syncing**, then ✓ **Synced**. Waiting count returns to 0. **Final receipt** replaces **Provisional receipt**.	If the count never drops, leave the counter open; after 15 minutes the chip warns **check internet**. Do not clear browser data.
O13	Offline, open **Register** and try **Close register**.	Close and **Print report** are disabled. Reason line: **You are offline. Reconnect to count or close the register.**	Closing offline is a defect.
O14	Check the owner page after syncing.	**Prepare for offline** shows **Waiting bills 0** and the cumulative figure has gone up by the bills sold.	The cumulative figure does not reset on sync. That is expected.

Part 7 — Day Close, Register Report and Z Summary

This part covers the cash register at the counter: how a register session starts, how to read the day summary, how to count the drawer and close the day, what the counter shows after a close, and how the register report (X while open, Z once closed) reads.

7.1 How a register session works

There is **no manual "open register" button**. A register session opens automatically with the first sale at a counter. When a different cashier takes over a drawer that still holds the previous cashier's cash, POS asks the incoming person to count it first (see the handover note below).

Moment	What happens
First sale of the day at a counter	A register session opens by itself.
Another cashier takes over	A mandatory count appears: **Count the cash before you start**. There is no skip button. A real count of zero is valid.
End of day	Someone counts the drawer (optional) and closes the register.
A sale after the close	A new register session opens with that sale. The sale is not blocked.

Handover count (staff change)

When another cashier's cash is still on the register, the incoming cashier is sent to **Count the cash before you start** on **Today**. Enter **Cash received in drawer**, then select **Start counter**. The screen shows the expected cash and then **Shortfall**, **Excess** or **Cash matches expected**. After **Cash handover recorded**, select **Open Today**. The next opening float is exactly the count you entered, including zero. An order taker cannot hand over or close a drawer.

7.2 Read the day summary (Today)

What it's for

A live summary of this register session: how much was sold, how it was paid, what was refunded and voided, and how much cash should be in the drawer.

Who uses it

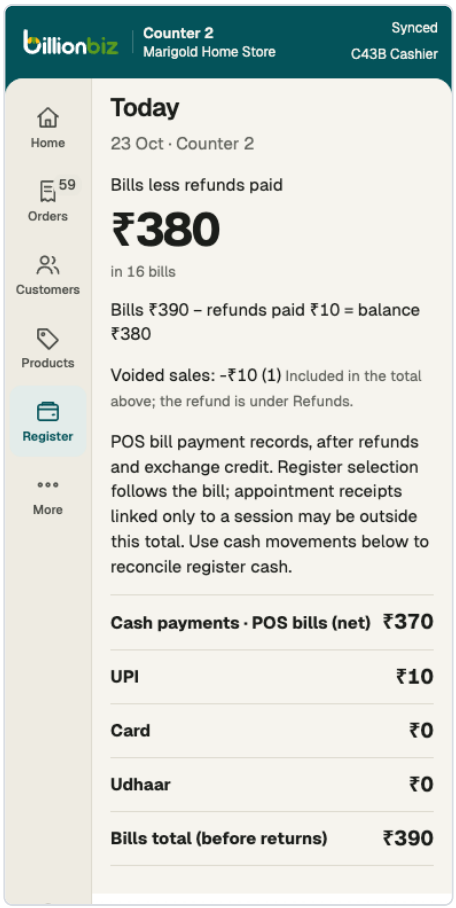

Cashiers, from the left rail: **Register**. Also reached from the **View day summary** button on the closed-register notice.

Step by step

1. On the counter, select **Register** in the left rail. The screen is headed **Today**, with the date and counter name beneath it. The session is labelled **This register session** (or **Today at this counter** when no session is open).
2. On the first page, read **Bills less refunds paid** (the amount, with **in N bills**). Under it are **Cash**, **UPI**, **Card**, **Udhaar** and **Bills total (before returns)**. A sentence spells out the sum, for example Bills ₹1,000 minus refunds paid ₹100 equals balance ₹900.
3. Select **Next** for **Refunds paid**, **Bills less refunds paid** and **UPI to check**. **Previous** goes back.
4. If a sale was voided, a line reads **Voided sales: -₹X (N)** with the note **Included in the total above; the refund is under Refunds.** If a booking deposit was kept, **Forfeited deposits: ₹X** appears. If a deposit was paid back in cash, **Deposits refunded in cash: -₹X** appears. Each line shows only when its amount is above zero.
5. Open **Cash in / out** (or **Cash movements for the day**) to see the opening float, cash sales, udhaar and gift cash, and cash out.

What the lines mean (the net figure)

The register report has no line labelled NET. The net figure is **Bills less refunds paid**: **Bills total (before returns)** minus **Refunds paid**.

Phone Today screen: Bills less refunds paid, Voided line, tender lines (390 wide)

Line	Meaning
Bills total (before returns)	Every bill taken, before any refund. Not a net figure.
Refunds paid	Money actually returned to customers, all tenders added up.
Bills less refunds paid	The net: bills total minus refunds.
Voided sales: -₹X (N)	N whole sales were cancelled. They stay inside Bills total. The refund is counted once under Refunds paid. This line names them; it changes no total.
Forfeited deposits: ₹X	Booking deposits the shop kept from cancelled or no-show bookings, after any refund. Not a refund.

Line	Meaning
Deposits refunded in cash: -₹X	Cash that left the drawer to refund a deposit. It lowers Expected in drawer.
UPI to check	UPI payments entered manually that the owner has not yet matched in the bank.

Void versus Undo. A voided paid bill keeps the sale in Bills total and counts the refund once, so Bills less refunds paid drops by the sale amount exactly one time. A sale removed with the short-window **Undo** has no refund and is excluded from both. If the net looks too low by exactly one bill, compare the voided bill with the returns list before assuming it was deducted twice.

7.3 Count the drawer and close the day

What it’s for

Records how much cash is physically in the drawer, compares it with what the system expects, and closes the day at this counter.

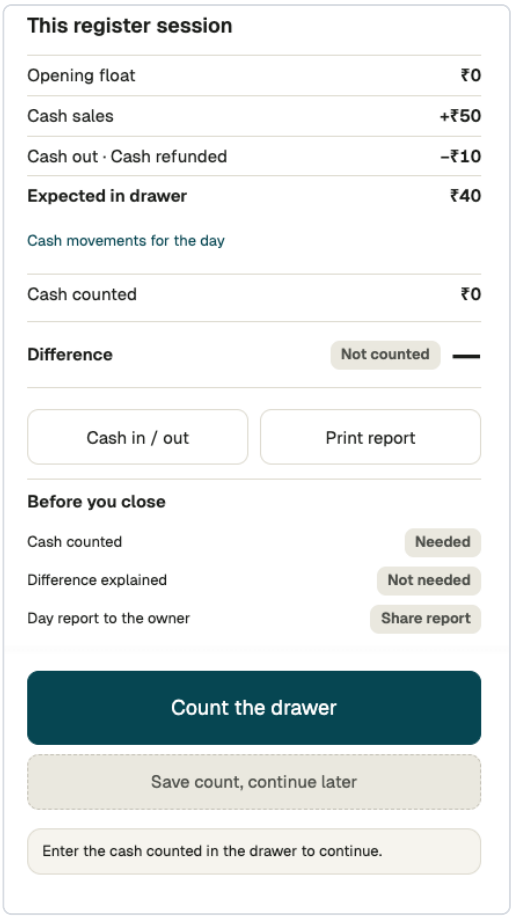

Who uses it

Cashiers (and owner or manager signed in on the counter). An order taker cannot close.

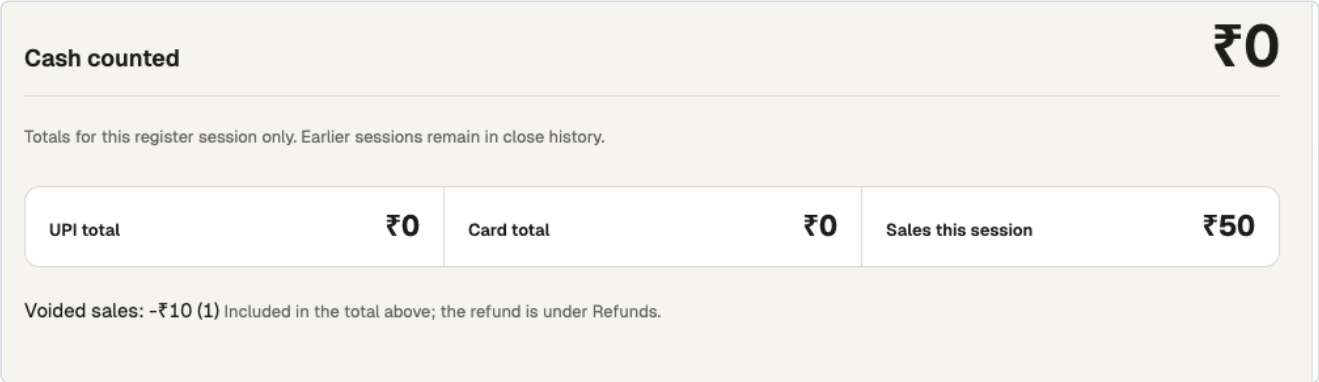

Step by step

1. Select **Register** in the left rail.
2. Select **Count the drawer**. The screen heads **Count the drawer** with **Enter how many of each note and coin are in the drawer.** and shows when the session was opened, for example **Opened 5:12 am**.
3. Enter how many of each note and coin: one row per note and coin value, starting at ₹2,000. Or select **Enter a total instead** and type the **Cash counted** total directly. Zero is valid.
4. The right panel (**This register session**) shows **Opening float**, **Cash sales**, **Expected in drawer**, **Cash counted** and **Difference**. The difference reads **Short by** or **Over by**, or **Cash matches expected**.

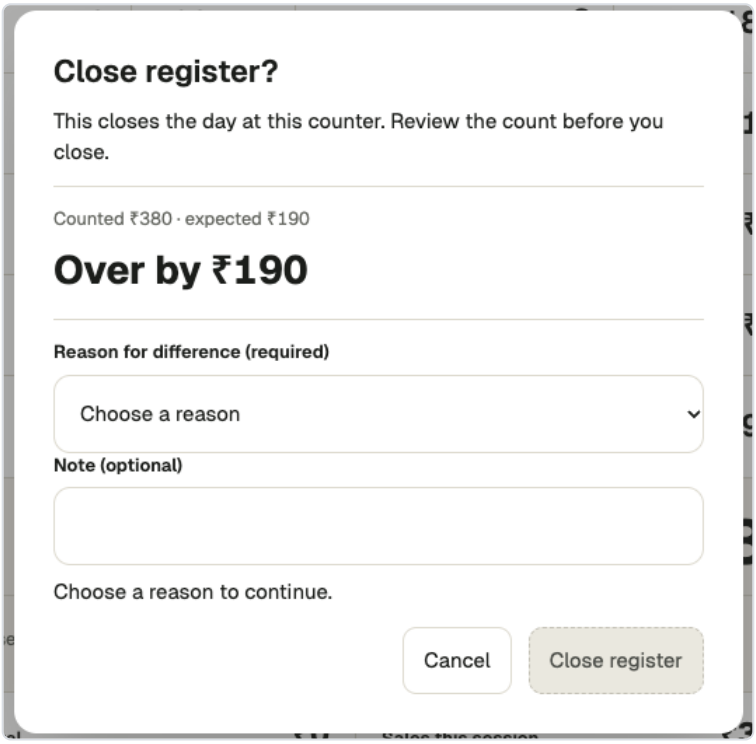

5. If the count differs from expected, **Reason for difference (required)** appears. Choose **Counting error**, **Cash expense** or **Other**, and optionally add a **Note (optional)** up to 200 characters.
6. Select **Close register**. A **Close register?** window opens: **This closes the day at this counter. Review the count before you close.** It repeats the count and expected amount (for example **Counted ₹380 · expected ₹190**, **Over by ₹190**).
7. If a reason is still missing, the window shows **Choose a reason to continue.** and **Close register** stays disabled. Choose a reason, then select **Close register** again. **Cancel** leaves without closing.
8. The **Counter closed** screen appears (see section 7.4).

Count the drawer screen with This register session figures

Count the drawer screen: the Voided sales line

Close register confirmation showing Over by and the required reason

Other buttons on the count screen

Button	What it does
Save count, continue later	Saves the count on this device for this register so you can finish later. Reads **Count saved on this device for this register.**
Close without counting	Closes the day with no count. The result reads **Not counted** and no cash difference is invented.

Button	What it does
Cash in / out	Opens the list of opening float, cash sales and cash out. A cashier also sees **Ask the owner** here.
Print report	Prints the register report (see section 7.5).

Counting at day close is **optional**. The count at **staff handover** is mandatory.

Why is Close register disabled?

A grey line beside the buttons gives the reason. Only one shows at a time.

Reason line	What to do
Loading the register. Wait a moment.	Wait for the summary to load.
You are offline. Reconnect to count or close the register.	Reconnect. Closing and printing need the server.
The register is locked. Unlock it to count or close.	Unlock the counter with your PIN.
No register session is open, so there is nothing to count or close.	Nothing is open. Check close history.
Enter the cash counted in the drawer to continue.	Enter the counted cash (zero is valid).

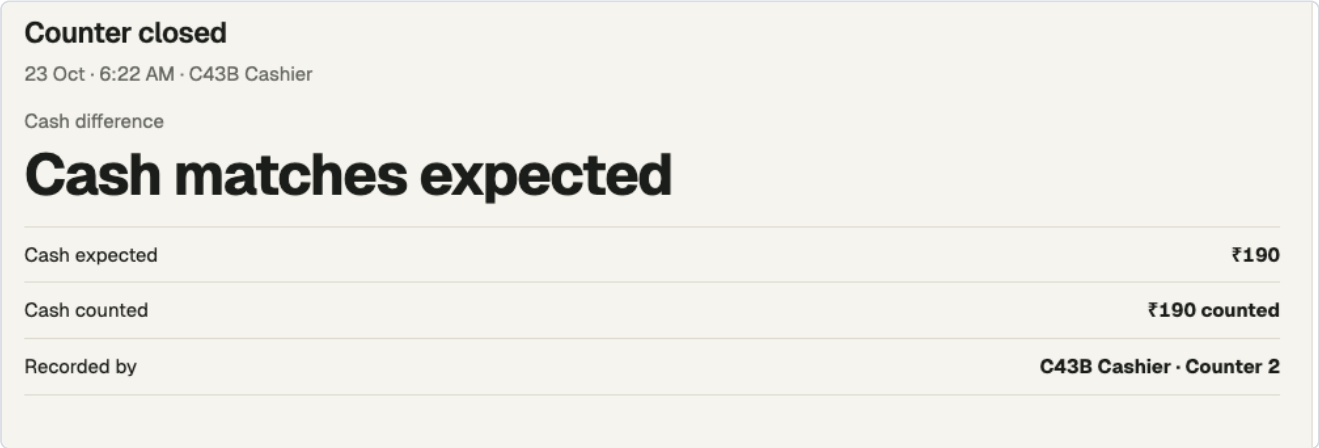

What happens behind the scenes

Closing writes a fixed closing snapshot (the Z report). It is written once. A later refund or bank check is added separately and never rewrites the closed totals.

7.4 After the close: the Counter closed screen and notice

What you see right after closing

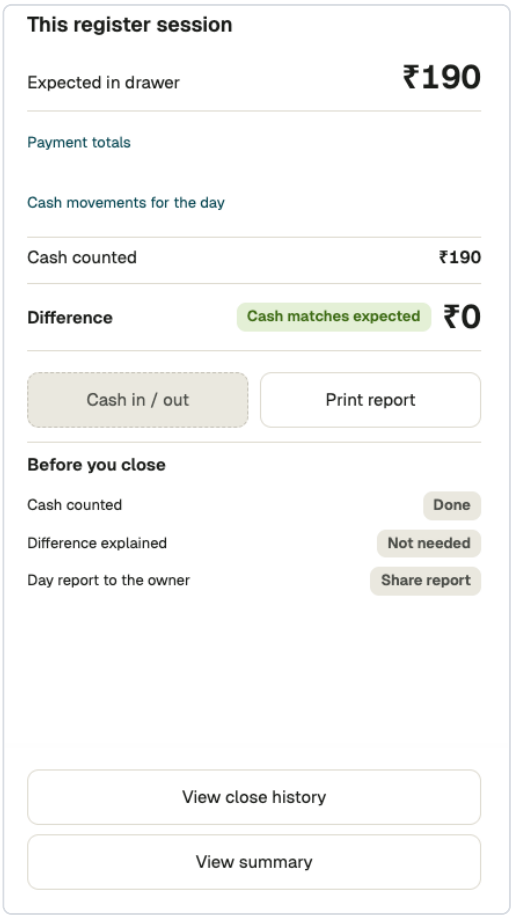

The **Counter closed** screen shows the closing time, the figure **Cash difference** (the shortfall, the excess or **Cash matches expected**) for a counted close, or **Cash count: Not counted** for an uncounted close, and **Recorded by**. Two buttons: **View summary** (back to the summary) and **View close history**.

Counter closed screen with Cash matches expected and Recorded by

The closed-register notice on the counter

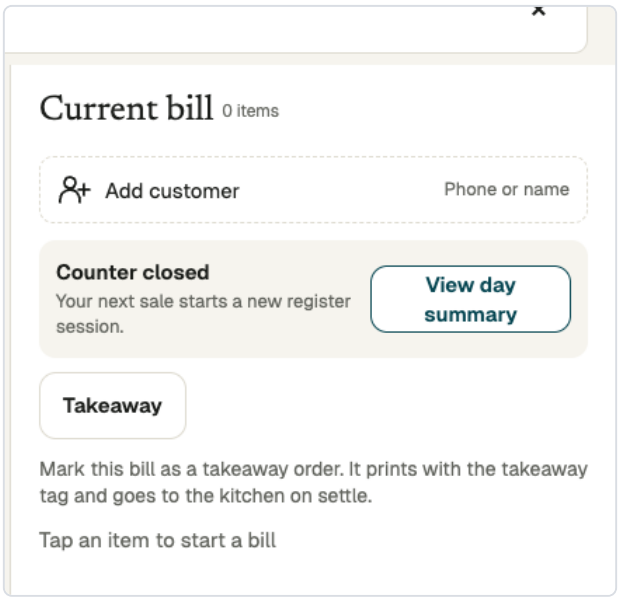

When the business day has a closed register and none open, the counter home shows a notice with three parts: **Counter closed**, the line **Your next sale starts a new register session.**, and a **View day summary** button that opens **Today**.

Counter closed screen: View close history and View summary

Screen size	Where the notice sits
Desktop (1536 wide)	In the bill column, above the **Takeaway** button, below **Add customer**.
Phone (390 wide) and the big-button and task home screens	One notice in the strip above the tender bar. With the bill sheet open, it sits inside the sheet.
Charge screen of a closed counter	Also shown, per the current default.

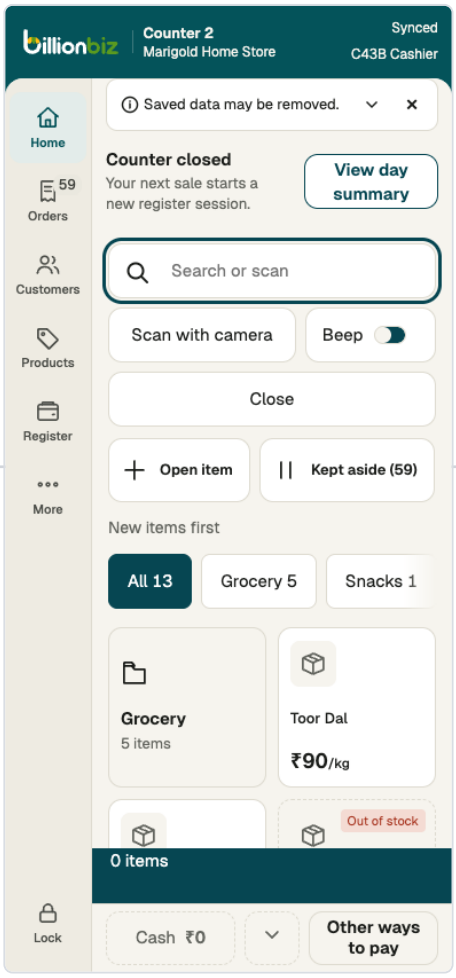

The notice stays after you reload the page and after you sign out and back in with a PIN. It does not show before the first sale of a day that has no closed register, nor while the register is open or still loading.

Desktop counter home with the Counter closed notice and View day summary

What if a sale is attempted after the close?

The sale is **not blocked** (open question W4, default adopted). The next sale opens a new register session and the notice goes away. Cash left in the drawer is carried over and counted once. Earlier sessions stay in close history, and the day summary says **Totals for this register session only. Earlier sessions remain in close history.**

Phone counter home with the Counter closed notice above the tender bar (390 wide)

7.5 The X and Z register report

What it’s for

A printable record of the register: X while it is open (a reading, nothing is closed), Z once closed.

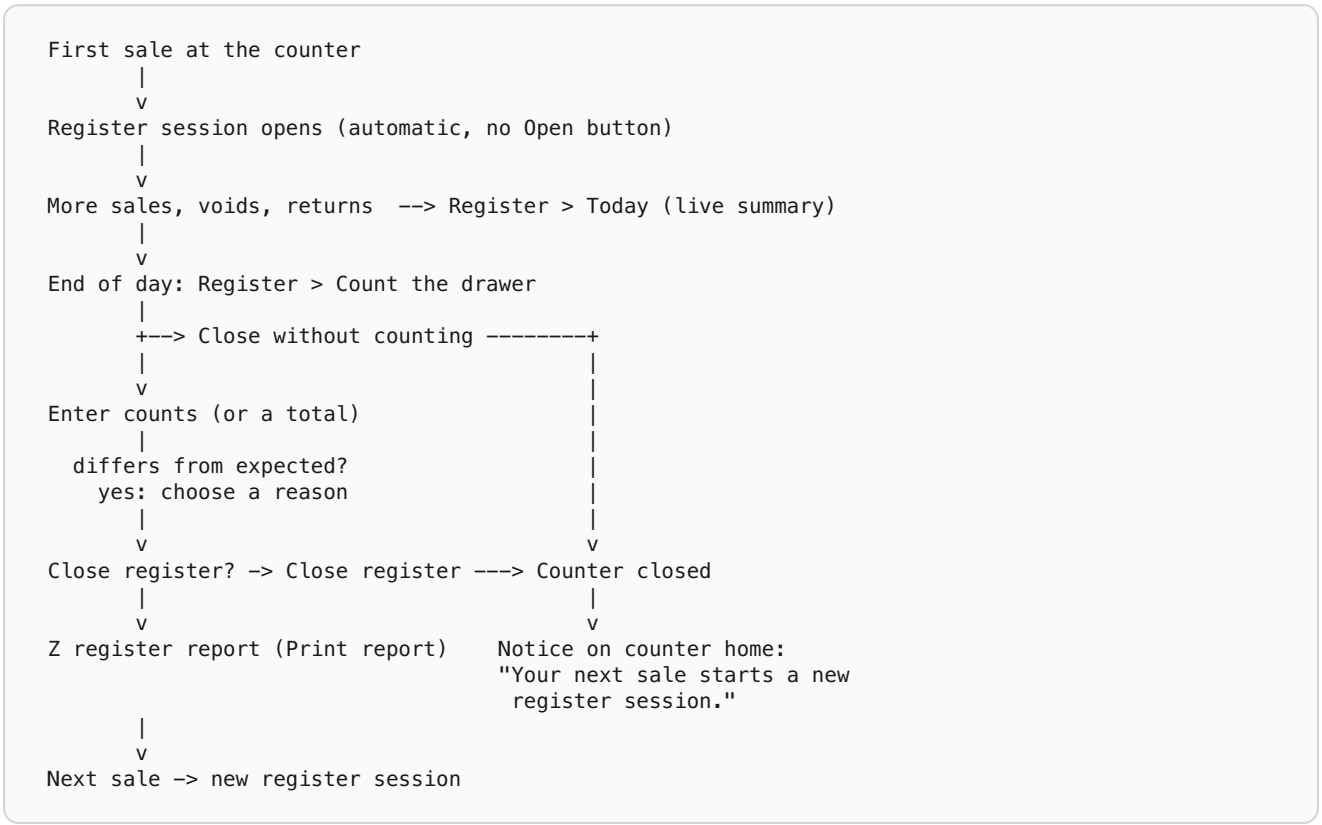

Step by step

1. On **Today**, select **Print report**. It sits next to **Cash in / out** on the register summary, or on its own at the bottom of other screens.
2. The report page is titled **X register report** while the register is open and **Z register report** once it is closed.

3. Read, in order: register name and business date, **in N bills**, **Bills total (before returns)**, **Voided sales** (printed **-₹X**, only if above zero), **Returns**, **Refunds paid**, **Deposits refunded in cash** (printed **-₹X**, only if above zero), **Forfeited deposits** (only if above zero), **Expected drawer cash**, **Cash counted** (or **Not counted**).
4. Below that: **Tax summary** (**Taxable amount**, and a table by **GST rate** with CGST, SGST, IGST) and **Tender totals** (cash, UPI, Card, and so on).

If a tax block cannot be shown, the report says tax details are unavailable. Printing needs the internet; offline, **Print report** is disabled with **You are offline. Reconnect to print the report.**

Flowchart

7.6 Test checklist — Day close

Fixtures: see Part 8, section 8.1. Run on one counter. Phone rows need a 390-wide window.

#	What you do	What you should see	If you see something else
D1	Take a cash sale on a counter with no open session.	Sale completes. No open-register prompt appeared.	A manual open step means an older build. Note the version.

#	What you do	What you should see	If you see something else
D2	Select **Register** in the left rail.	**Today** with date and counter, **This register session**, and **Bills less refunds paid** with **in N bills**.	A blank screen: reload once and note the error.
D3	Select **Next**, then **Previous**.	Page 2 shows **Refunds paid**, **Bills less refunds paid**, **UPI to check**.	
D4	Void one paid bill (see the returns and voids part of this guide), then reopen **Today**.	**Voided sales: -₹X (1)** with **Included in the total above; the refund is under Refunds.** Bills total unchanged. Expected in drawer drops by the cash refund.	If Bills total dropped, record it as a defect.
D5	Select **Count the drawer**.	**Count the drawer** screen with note and coin rows and **This register session** panel.	
D6	Enter a total that differs from expected.	**Difference** shows **Short by** or **Over by**. **Reason for difference (required)** appears.	No reason prompt on a mismatch is a defect.
D7	Select **Close register** without choosing a reason.	**Close register?** window shows **Choose a reason to continue.** and the button is disabled.	The close going through without a reason is a defect.
D8	Choose **Counting error**, then **Close register**.	**Counter closed** screen with **Cash difference**, **Recorded by**, **View summary**, **View close history**.	
D9	Repeat on a fresh session, enter a count equal to expected.	**Cash matches expected**. No reason requested.	
D10	Repeat on a fresh session using **Close without counting**.	**Cash count: Not counted**.	A made-up difference figure is a defect.
D11	Return to the counter home (desktop).	**Counter closed**, **Your next sale starts a new register session.**, **View day summary** in the bill column.	
D12	Reload, or lock and sign back in with a PIN.	The same notice is still there.	The notice vanishing before a new sale is a defect.
D13	Open the counter on a 390-wide phone window.	One notice above the tender bar. With the bill sheet open it sits inside the sheet. **View day summary** opens **Today**.	Two notices at once is a defect.
D14	Take a sale on the closed counter.	The sale completes, a new register session opens, the notice disappears.	A blocked sale contradicts the W4 default. Record it.
D15	Print the report from **Today**.	**X register report** (open) or **Z register report** (closed) with the lines in section 7.5.	**Share report** was not walked (Part 8, section 8.2).
D16	Cut the connection and open **Register**.	**Close register** and **Print report** disabled. **You are offline. Reconnect to count or close the register.**	

Part 8 — Test Run Order, Known Limits, Troubleshooting and Glossary

8.1 End-to-end QA run order

Run the parts in this order. Each part has its own checklist table; do not repeat them here, run them. Use the row numbers in the part itself.

Step	Run	Checklist
1	Fixtures and sign-in	Set up the fixtures below, then sign in at both counters.
2	Part 3	Every row of the Part 3 checklist, in order.
3	Part 4	Every row of the Part 4 checklist, in order.
4	Part 5	Every row of the Part 5 checklist, in order.
5	Part 6, online prep	Rows O1 to O2 of the Part 6 checklist.
6	Part 6, network down	Rows O3 to O14 with the device network switched off.
7	Part 6, server blocked	Rows O3 to O12 again with the network on but the server unreachable.
8	Part 7	Rows D1 to D16 of the Part 7 checklist. Run D16 after Part 6 so you know offline close is blocked.
9	Second counter	Repeat Part 7 rows D1, D2 and D8 on counter two to confirm each counter closes on its own.

Order matters in two places. Run the Part 6 sales before the Part 7 close so the offline bills have synced and show in the day totals. Run the Part 7 close last, because it closes the day at that counter.

Fixtures

Item	What to use
Admin login	A UAT store-owner login for a store with the POS add-on enabled. Never print or paste the credentials into a report.
Store	A test store (never a real merchant). Stock tracked at store level, not per location, or offline preparation will refuse.
Counters	Two counters (two approved counter devices), so a handover count and a per-counter close can be checked.
Cashiers	At least one cashier PIN, plus one more for the handover count. An order taker PIN for the blocked-action checks.
Catalog	At least a dozen products, including one weighed item and one stock item at zero.
Owner prep	Offline copy prepared on counter one before step 6.
Same store	If you also touch the Customer Portal, use the same store on both sides.
Do not	Do not run real UPI or card payments. Do not clear browser storage during offline rows.

8.2 Known limitations and open items

These are the behaviours adopted after the R40 walk and the R41 review. Each is the current default.

Rulings in force (current behaviour)

Ref	What happens today
W1	A takeaway bill settles even if the kitchen ticket could not be delivered (for example no kitchen printer). The kitchen issue shows on the Orders rail and blocks only the ready and handover steps. Tell the kitchen by hand.
W2	The **Takeaway** button is hidden on retail (non-kitchen) counters. It shows only when the store has the restaurant add-on active.
W3	A dine-in payment still waits on an unresolved kitchen ticket. This older check is kept.
W4	After an end-of-day close, a new sale opens a new register session and is not blocked. The **Counter closed** notice shows on the counter home and on Charge for a closed counter.
W5	The walk-in split is per appointment: **Customer is here now (walk-in)** and **Add contact details**. There is no store-level setting.
W6	Manual UPI is not available offline. Offline takes cash only. UPI, Manual UPI, Card and Split are refused.
W7	The new-appointment page says **Use an existing contact** (on by default) while the composer dialog says **Add contact details** (off by default). Left as it is, follow-up item.

Other rulings: the booking deposit stays a percentage; offline cash selling is enabled this release; the refund choice for deposits governs no-shows only, and counter cancels follow the cancellation window.

Not yet walked

The R40 local walk did not run these. Treat their behaviour as unverified until walked.

Item	Status
Share report from the day summary	Not yet walked.
QR table orders (R9)	Not yet walked.
Kitchen-confirm remainder: receipt-not-ready state, the Orders-rail confirm, pickup resolve	Not yet walked.
Dine-in table bill shows the Takeaway line	Not yet walked.
Voided, forfeited and deposit-refund lines consistent on one fresh session	Not yet walked.
Owner review path for held offline bills (Review held bills, Recovery details)	Not walked in R40.
Offline status on UAT	True offline is switched on for UAT (all six offline settings were enabled and checked on the running services on 23 October 2026). Each counter must still be prepared for offline while online before it can sell offline (see Part 6).

Known rough edges

- **After an offline Paid** the cashier lands on an empty counter. The only confirmation is the header count (for example **Offline · 1 bill waiting**) and the provisional line in **Details**. There is no on-screen paid confirmation.
- **A draft started online cannot be sold offline.** It must be paid online or rebuilt as a new bill.
- **Hosting header.** In the built-bundle check, a response header on asset files broke the saved-page cache until a plain static server was used. Whether UAT and PROD send that header is open. If the counter fails to load offline after a cold start, report it.
- **Owner and manager PIN Today views** are limited. Date, Top items, Owner alerts, date-wide close history and Added after close cannot be relied on from a PIN session. Use the admin counter sales report for store-wide figures.
- **Offline limit.** 300 bills or ₹2 lakh. Sending bills does not reset it.

8.3 Troubleshooting

Symptom	Likely cause	What to do
Charge is disabled and the counter says **You are offline. Reconnect before saving or taking payment.**	The device was never prepared or its offline access ended.	Reconnect. The owner opens **Prepare for offline**, runs **Prepare offline copy**, then **Use this copy**.
Header stays on **Offline** though Wi-Fi is on	The server is unreachable even though the network is up.	Check the shop network and the service status. The counter returns to **Synced** by itself within a few checks.
UPI and card need a connection. Take cash, or wait until you're back online.	You chose UPI, Card or Split while offline.	Take cash, or wait for the header to say **Synced**.
This bill was started online, so it can only be paid when the connection is back.	The bill was created before the connection dropped.	Wait and pay the same bill, or start a new bill.
Offline limit reached	300 bills or ₹2 lakh sold offline on this lease.	Reconnect, then prepare again online.
Offline access has ended.	The lease expired.	Reconnect and prepare again.
Waiting bills: N will not go down	Still offline, or a bill needs owner review.	Check the header. If it is red (**Needs attention**), the owner opens **Prepare for offline** and uses **Review held bills**. Do not clear browser data.
N bills waiting over 15 minutes — check internet.	Bills could not be sent for 15 minutes.	Check the internet. The bills stay saved.
Prepare says the store cannot prepare	The store tracks stock per location, or the device is not bound and approved.	Offline selling is not available for per-location-stock stores. Otherwise approve the device first.
Return shows **Needs internet**	Returns need the server.	Do the return after reconnecting.

Symptom	Likely cause	What to do
Close register is disabled	A reason line beside it explains why.	Follow the line (section 7.3 table).
Close register? will not confirm	The count differs from expected and no reason is chosen.	Choose **Counting error**, **Cash expense** or **Other**.
Net looks one bill too low	A voided bill is inside Bills total and its refund is in Refunds paid.	Compare the **Voided sales** line with Refunds paid. It is counted once.
Counter closed notice shows but you want to keep selling	The day was closed.	Take the sale. It opens a new register session and the notice goes away.
No open-register button	There is none by design.	The first sale opens the session.
Provisional receipt number looks short, like #7	It is the bill's short number on this device.	Write it on the customer's copy. The final invoice number replaces it after sync.
Print report is disabled	Offline, or the screen is still loading.	Reconnect and wait for the page to load.

8.4 Screen index

Screen or control	Where it is described
Prepare for offline (Counter devices, Settings)	Part 6, section 6.2
Counter header sync status (Synced, Offline, Syncing, Needs attention)	Part 6, section 6.3
Offline strip and Details panel	Part 6, section 6.3
Charge, Cash keypad while offline	Part 6, section 6.4
UPI, Card, Split refusal	Part 6, section 6.5

Screen or control	Where it is described
Waiting bills chip, owner review, Undo unsent sale	Part 6, section 6.6
Today (register summary)	Part 7, section 7.2
Count the cash before you start (handover)	Part 7, section 7.1
Count the drawer	Part 7, section 7.3
Close register? confirmation	Part 7, section 7.3
Counter closed screen, close history	Part 7, section 7.4
Counter closed notice on the home screen	Part 7, section 7.4
X register report, Z register report, Print report	Part 7, section 7.5
Counter home, Charge, Orders, Customers, Products	Parts 3 to 5 (see their contents pages for the exact section)

8.5 Glossary

Term	Meaning
Bills less refunds paid	The net figure on Today and on the register report: Bills total (before returns) minus Refunds paid.
Business day	The day the register totals belong to. The day start is set in the counter settings.
Counter closed notice	The message on the counter home after the day is closed: **Your next sale starts a new register session.**
Deposit	Money a customer pays up front to hold a booking. A percentage of the booking price.
Device lease	The time-limited permission an owner grants a prepared device to sell offline (300 bills or ₹2 lakh).
Forfeited deposit	A deposit the shop keeps from a cancelled or no-show booking. Shown as **Forfeited deposits**.

Term	Meaning
KOT	Kitchen order ticket. The slip sent to the kitchen when a restaurant bill is sent or settled.
No-show	A booking where the customer did not arrive. The deposit rule for no-shows is set by the owner.
Offline copy	The checked catalog saved on the counter browser by **Prepare offline copy**.
Provisional receipt	The receipt saved on the device for an offline sale, marked **Not a GST invoice**. Replaced by the final receipt after sync.
Queue	The list of offline sales saved on the device, waiting to be sent to the server.
Register session	One run of the cash drawer at a counter, from its first sale to its close.
Seat	A cashier seat: one cashier login the plan allows. The owner uses no seat.
Split	Paying one bill with more than one method (for example part cash, part UPI). Refused offline.
Takeaway	A counter bill marked as take-away. It prints with a takeaway tag and goes to the kitchen on settle. Restaurant stores only.
Tender	A payment method: Cash, UPI, Card, Split, Udhaar.
Tombstone	The internal name for the “undo an unsent offline sale” record. Not shown on screen. Users see **Undo unsent sale**.
Udhaar	Customer credit: the customer takes goods now and pays later.
Void	Cancel a whole paid bill and refund it. The bill stays in Bills total and shows under **Voided sales**; the refund is in Refunds paid.
Return	The customer brings back some or all items. It is counted as a refund. A void cancels the whole bill; a return can be partial.
X report	The register report while the register is open: a reading that closes nothing.
Z report (Z summary)	The register report after close: the fixed closing snapshot, written once.
